11 Install throttle shaft and valve Valve must be installed with trademark c on side toward idle port when viewing from flange side Always use new screws With valve screws loose and throttle lever set screw backed out seat valve by tapping lightly with a small screw driver Hold in place while tightening screws

12 (N 2056S) Install nozzle mak ng sure it seats in casting

13 Install needle seat needle float and float p n

14 Set float level With carbureter casting inverted float resting lightly against needle in its seat there should be (N 2056S) 11/64" (N 2450S) 13/64" clearance between outer edge of casting and free end of float (side opposite needle seat) Adjust by bending lip of float with small screw driver

15 Install bowl ring gasket bowl bowl nut gasket and bowl nut Tighten securely after making sure bowl is centered in gasket

16 Install low speed jet and high speed needle assembly Turn in until it seats in nozzle then back out 1½ turns

17 Then install idle adjusting screw finger tight Back out approximately 1½ turns DO NOT USE PLIERS OR SCREW DRIVER AS IT MAY DAMAGE IDLE SCREW

HIGH SPEED AND IDLE SCREW ADJUSTMENT

After rebuilding and installation on engine s complete the high speed and idle screw adjustments must be made With the high speed needle turned counter clockwise (from closed position) 1½ turns and idle screw turned 1½ turns open start engine

With the engine at normal operating temperature accelerate engine and check response The high speed needle should be adjusted for the leanest possible mixture which will allow satisfactory acceleration and steady governor operation If the engine misses and backfires the high speed mixture is too lean and the high speed adjustment screw must be turned counter clockwise ⅛ turn at a time to correct this condition If the engine loads (heavy exhaust) and is sluggish the mixture is too rich and the high speed adjustment screw must be turned clockwise ⅛ turn at a time to correct To make final check of the high speed adjustment operate the engine under load and adjust

The idle screw should be adjusted intermittently while making the high speed adjustment The final idle adjustment should be made at a speed not less than 1600 r p m DO NOT USE FORCE ON THE HIGH SPEED NEEDLE OR IDLE SCREW AS DAMAGE MAY RESULT

AFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2855S 2856S**

CARBURETER SPECIFICATIONS

For Plymouth 8 Cylinder 360 Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange, four-bore – 4 bolt type.
Throttle bore, 1-7/16 inch.
Primary venturi size, primary side, 7/16 inch; secondary side, (2856S) 11/32 inch, (2855S) 7/16 inch I.D.
Main venturi size, 1-3/16 inch.

Vents: Inside (4) in air horn; Outside (5) in air horn.

Low Speed Circuit: (Primary side only)
Jet, size No. 66 (.033 inch) drill.
By-pass, size (.0492 inch) diameter.
Economizer, size (2855S) (.0492 inch) (2856S) (.0452 inch) diameter.
Idle Bleed, size (.0492 inch) diameter.
Idle port, slot type, length .198 inch, width .030 inch.

Idle Port Opening: .142 to .148 inch above top edge of valve with valve tightly closed.

Set Idle Adjustment Screw: 1/4 to 2-1/4 turns open. For richer mixture turn screw out. Do not idle engine below 650 R.P.M.
Transmission in neutral.

Main Nozzle: Install permanently. DO NOT REMOVE. Anti-percolator bleed, primary (tube in venturi assembly), size No. 68 (.031 inch) drill.
Secondary (drilled hole in venturi assembly) size No. 60 (.040 inch) drill.

Main Vent Tube: (In venturi assembly) Side holes primary side 11 – size No. 70 (.028 inch) 1 – size No. 65 (.035 inch) drill; secondary side (2856S) 2 – size No. 57 (.043 inch) 1 – size No. 70 (.028 inch) (2855S) 11 – size No. 70 (.028 inch) drill.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 70 (.028 inch) drill. Intake ball check seat (screw plug) size .115 to .120 inch diameter. Discharge needle seat size No. 50 (.070 inch) drill.

Choke: Carter Climatic® Control Cross over type, set on index. Butterfly type offset valve, primary side only. Choke heat suction hole, in air horn, size No. 44 (.086 inch) drill.

Vacuum Spark Port: Slot type (round end) .045 x .110 inch. Top of port .026 to .034 inch above top edge of valve with valve tightly closed.

Motor Tune-Up–Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Float Setting	Idle Adjustment Screw Setting
.035"	.017"	7½° B. T. C. At Vibration Damper	7/32 Inch (Use Gauge T109-106)	¼ to 2¼ Turns Open Idle Engine at 650 R. P. M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters – NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 7/32 inch (gauge T109-106) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, b nd stop tabs on float brackets.

PUMP: 7/16 inch from top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center on fast idle screw with ind x mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .015 inch (gauge T109-44) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1400 R.P.M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/4 inch (gauge T109-31) betw n upp r dge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 3/8 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030"(gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

CHOKE ADJUSTMENT (CROSS OVER TYPE) SEE FORM 3657: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears side of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

TOOLS REQUIRED FOR SERVICING CARBURETERS:

In Neutral

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3656

Float Level 9/32 inch (Gauge T109 239) between top of each float ridge (at center of float) and top surface of body casting To adjust bend lip on float arm

Pump: 1⅛ inch from the top of the bowl cover to the top of the plunger shaft Install throttle connector rod in center hole (medium stroke) of throttle lever and inner hole of pump arm To adjust bend throttle connector rod

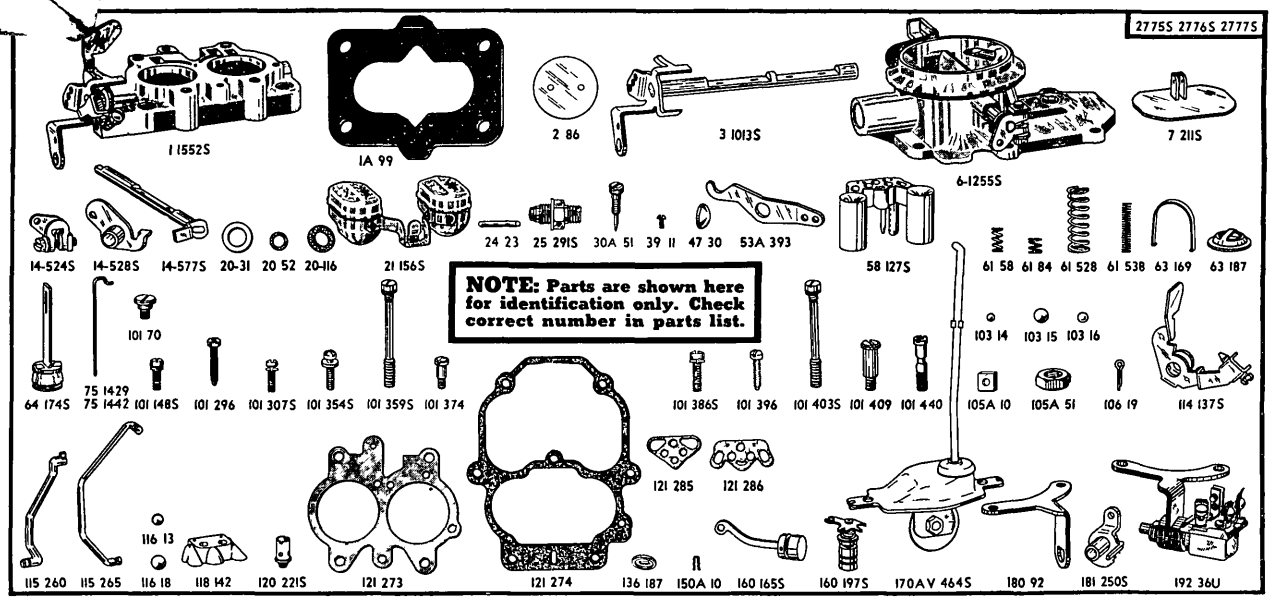
Fast Idle Cam Clearance: With choke valve closed and lip on inner choke shaft lever contacting lug on outer lever align index mark with adjusting screw To adjust bend lip on inner choke shaft lever

Fast Idle Throttle Valve Clearance· 015 (Gauge T109-44) between lower edge of valve and bore with adjusting screw on index mark of cam

Fast Idle on Car: 1400 R P M, hot engine with fast idle screw on index mark of cam

Unloader: ¼ inch (Gauge T109 31) between top edge of choke valve and inner wall of air horn with throttle valves wide open To adjust bend unloader arm on throttle lever

Overdrive Kickdown Switch: With throttle valves wide open there should be 1/64 inch to 3/64 inch between kickdown lever and switch stem guide To adjust loosen lock nuts and adjust switch



Choke Adjustment (Cross Over Type) See Form 3657: I Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed under carbureter specifications Hold in this position with screw driver and tighten lock nut NOTE Screw driver may be held

CARBURETER SPECIFICATIONS

For Plymouth 8 Cylinder 318 Cu. In. Engine: Vacuum at Idle 19.5 Inches

For Plymouth 8 Cylinder 313 Cu. In. Engine: Vacuum at Idle 19.5 Inches (Canadian)

Dimensions: Flange four-bore—4 bolt type
Throttle bore, 1-7/16 inch
Primary venturi size primary side 7/16 inch, secondary side, (2812S) 11/32 inch, (2813S) 7/16 inch I D
Main venturi size, 1-3/16 inch

Vents: Inside (4) in air horn, Outside (4) in body, (5) in air horn

Low Speed Circuit: (Primary side only)
Jet size (2812S) No 68 (031 inch), (2813S) No 66 (033 inch) drill
By pass, size (0492 inch) diameter
Economizer, size (0452 inch) diameter
Idle bleed size (0492 inch) diameter
Idle port, slot type length 198 inch, width 030 inch

Idle Port Opening: 142 to 148 inch above top edge of valve with valve tightly closed

Set Idle Adjustment Screw: 3/4 to 2 1/4 turns open For richer mixture turn screw out Do not idle engine below 500 r p m Transmission in neutral

Main Nozzle: Install permanently DO NOT REMOVE Anti percolator bleed, primary (tube in venturi assembly) size No 68 (031 inch) drill Secondary (drilled hole in venturi assembly) size No 60 (040 inch) drill

Main Vent Tube (In venturi assembly) Side holes primary side 11—size No 70 (028 inch) 1—size No 65 (035 inch) drill secondary side (2812S) 2—size No 57 (043 inch) 1—size No 70 (028 inch) (2813S) 11—size No 70 (028 inch) drill

Accelerating Pump· Discharge jet (twin) primary side only size No 70 (028 inch) drill Intake ball check seat (screw plug) size 115 to 120 inch diameter Discharge needle seat size No 50 (070 inch) drill

Choke: Carter Climatic® Control Cross over type set (2812S) on index (2813S) 2 points rich Butterfly type offset valve, primary side only Choke heat suction hole in air horn size No 44 (086 inch) drill

Vacuum Spark Port: Slot type (round end) 045 x 110 inch Top of port 026 to 034 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3734

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 7/32 inch (gauge T109-106) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 7/16 inch from top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

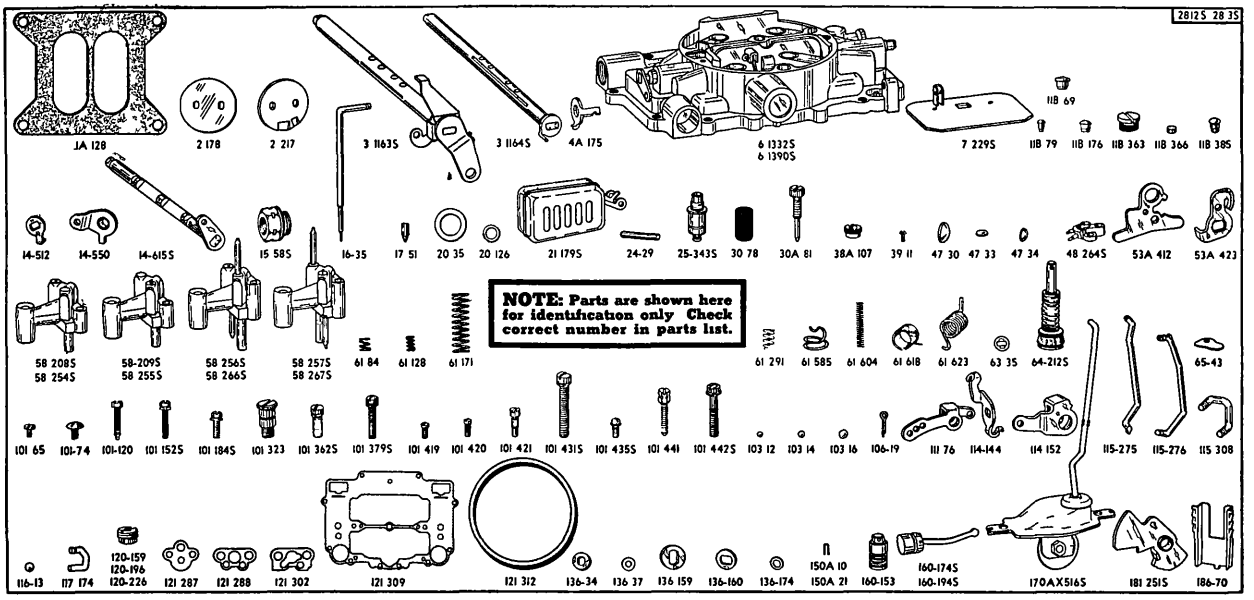
FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center on fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .012 inch (gauge T109-200) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1400 R. P. M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/4 inch (gauge T109-31) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 3/8 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.



SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

CHOKE ADJUSTMENT (CROSS OVER TYPE) SEE FORM 3657: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears side of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

WCFB Four-Bore Down-Draft Climatic® Control Carbureters Nos. 2761S-2762S

CARBURETER SPECIFICATIONS

For Plymouth 8 Cylinder 318 Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange size, 1-1/4 inch. Four Bore--4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 1 inch.
Main venturi (secondary) size, 1-1/8 inch I.D.

Vents: Outside, (4) in air horn, (4) in flange.
Inside, (7) in air horn.

Low Speed Circuit: (Primary side only) Jet, size No. .65 (.035 inch) drill. By-pass, in body, size No. 52 (.0635 inch) drill. Economizer, in low speed jet plug, size (2761S) (.0492 inch), (2762S) No. 54 (.055 inch) drill. Idle bleed; in body, size No. 52 (.0635 inch) drill. Idle port, slot type, length .156 inch; width .030 inch.

Idle Port Opening: .087 to .093 inch above top edge of valve with valve tightly closed.

Lower Port: (For idle adjustment screw), size No. 53 (.0595 inch) drill.

Set Idle Adjustment Screw: 3/4 to 1-3/4 turns open. For richer mixture turn screw out. Do not idle engine below 650 r.p.m. in neutral.

Idle Air Adjusting Screw: Seat size .187 inch diam ter.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating bleed (primary, in plug) size N . 60 (.040 inch) drill; Secondary, none.

Accelerating Pump: Discharge jet (twin) primary sid only No. 73 (.023 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diam ter.
Discharge relief plug size No. 55 (.052 inch) drill.

Choke: (2762S only) Carter Climatic® Control, set one point rich. Butterfly type--offset choke valve, primary side only. Choke heat suction hol , restriction in bushing between air horn and pist n housing size No. 50 (.070 inch) drill.

Vacuum Spark Port: (2762S only) Horizontal slot (r und end) .064 x .120 inch. Top of port .016 to .024 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

MARCA REGISTRADA

LITHO IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made -- lateral and vertical.
LATERAL ADJUSTMENT: With bowl cover assembly inv rt d, bowl cover gasket removed and float r sting on s ated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gaug . Adjustm nt should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance betw en top cent r of float and machined surface of casting must be 7/32 inch (gauge T109-283) for primary floats and 11/32 inch (gauge T109-285) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, th distance between top of floats and bowl cover should be 23/32 inch for primary floats and 27/32 inch for secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in center hole (medium stroke) of pump arm, with ends ext nding toward countershaft arm. Back out throttle lever stop screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cov r boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rod in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

FAST IDLE ADJUSTMENT: (2762S only) (a) Loosen choke lever clamp screw on choke shaft. Insert .010 inch feeler gauge (T109-200) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position -- hold in place and tighten clamp screw. (b) With choke valve tightly closed bend fast idle adjusting tang until there is .018 inch (gauge T109-44) opening between throttle valve and bore of carbureter side opposite idle port. Be sure fast idle adjusting tang is on high step of cam while making this adjustment.

FAST IDLE ON CAR: (2762S only) 1550 to 1600 R.P.M. hot engine with idle adjusting tang on high step of cam.

UNLOADER ADJUSTMENT: (2762S only) With throttle wide open there should be 1/8 inch (gauge T109-36) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever stop screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To, adjust, remove dust cover and bend vapor vent arm.

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time. NOTE: Secondary throttle valves will be a few degrees from wide open. To adjust, bend throttle operating rod at angle. (Use bending tool T109-213). With primary and secondary throttle valves in tightly closed position there should be .010--.030 inch (gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: (2762S only) This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and hold choke valve tightly closed. Then close throttle. Lock-out dog on auxiliary throttle shaft should feely engage in notch of lock-out arm. If necessary to adjust, bend lock-out dog on auxiliary throttle shaft.

IDLE SPEED AND MIXTURE ADJUSTMENT (NORMAL ENGINE TEMP.): In making the idle adjustment on the engine, the air adjustment screw is used to adjust idle speed in a similar manner as the throttle speed screw used previously. Turning the air adjustment screw outward increases engine speed, but also leans mixture supplied to the manifold which must be compensated for by adjustm nt of the idle mixture adjusting screws.

2653S Rear Carbureter

AFB Four-Bore Down-Draft Climatic® Control Carbureters Nos. 2652S-2653S

CARBURETER SPECIFICATIONS

For 8 Cylinder (LP2-S) 350; (LD3-S, LS3-S) 360 Cu. In. Engine

Dimensions: Flange, four bore - 4 bolt type. Throttle Bore, primary, 1-7/16 inch; secondary 1-9/16 inch I. D.
Primary venturi size, primary side, 7/16 inch, secondary side, 11/32 inch I. D.
Main venturi size, primary side 1-1/16 inch, secondary side, 1-1/4 inch I. D.

Vents: Inside (4) in air horn. Outside (5) in air horn (4) in body.

Low Speed Circuit: (Primary side only)
Jet, size (early prod.) No. 70 (.028 inch), (late prod.) No. 68 (.031 inch) drill.
By-pass, size (.0492 inch) diameter.
Economizer, size No. 57 (.043 inch) drill.
Idle bleed, size No. 55 (.052 inch) drill.
Idle port, slot type, length .166 inch; width .030 inch.

Idle Port Opening: (2652S) .094 to .100 inch; (2653S) .085 to .091 inch above top edge of valve with valve tightly closed.

Set Idle Adjustment Screw: 1/4 to 1-1/2 turns open. For richer mixture turn screw out. Do not idle engine blow 650 R.P.M. Transmission in neutral.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolator bleed, primary, (tube in venturi assembly) size No. 70 (.028 inch) drill. Secondary, drilled hole in venturi assembly) size No. 60 (.040 inch) drill.

Main Vent Tube: (In venturi assembly, primary siz only). Side holes 11 - size No. 70 (.028 inch) drill, 1 - size N . 65 (.035 inch) drill.

Secondary Initial Discharge: (In venturi assembly). Pick up tube size No. 60 (.040 inch) drill. Air bleed siz (.0275 inch) diameter. Discharge port size No. 53 (.0595 inch) drill.

Accelerating Pump: Discharge jet (twin) primary sid only, size No. 68 (.031 inch) drill. Intake ball check seat (screw plug), size .115 to .120 inch diameter. Discharge needle seat size No. 50 (.070 inch) drill.

Choke: (2653S) Carter Climatic® Control set 1 point rich. Butterfly type - offset choke valve, primary side only. Ch ke heat suction hole, bushing between body and piston housing, size No. 48 (.076 inch) drill.

Vacuum Spark Port: (2653S) Slot type, length .110 inch, width .045 inch. Top of port .000 to .004 inch above upper edge f valve withvalve tightly closed.

Motor Tune-Up – Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Float Setting	Idl Adjustment Screw Setting

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT

CARBURETER ADJUSTMENTS

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: (2652S) (with 21-188S floats) 3/8 inch (gauge T109-80), (with 21-179S floats) 9/32 inch (gauge T109-126). (2653S) (with 21-188S floats) 5/16 inch (gauge T109-107) (with 21-179S floats) 7/32 inch (gauge T109-106) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

NOTE: Identify 21-188S floats by smooth sides, 21-179S by ribs on floats.

FLOAT DROP: 23/64 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float bracket.

PUMP: 7/16 inch from the top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: (2653S only) .040 inch (Gaug T109-193) b tween choke l v r and stop in piston h using with ch ke valve cl sed. To adjust, bend choke connect r r d.

FAST IDLE LINKAGE ADJUSTMENT: (2653S only). With choke valve tightly closed and lug on outer chok shaft l ver contacting stop on inner choke shaft lever align center f fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: (2653S only) .012 inch (Gauge T109-200) between low r dge of valve and bore with adjusting screw on index mark f cam.

FAST IDLE ON CAR: (2653S only) 1450 R.P.M. hot engin with fast idle screw on index mark of cam.

UNLOADER: (2653S only) 1/4 inch (Gauge T109-31) betwe n upper edge of choke valve and inner wall of air horn. T adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 23/64 inch b tween l w r edge of primary valve and bore (opposite idl p rt) sec ndary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary valves in tightly closed p sition there should be .010" t .030" (Gaug T109-29) betw en positiv cl sing shoes on primary and secondary thr ttle lev rs. T adjust bend sho n sec ndary l ver.

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

LITHO IN U.S.A.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: (2653S nly) 1. Crack throttle valves and manually open and close the choke 'valve. Tang on secondary throttle lever should freely engage in notch f lock-out dog. T adjust, bend tang on secondary Throttle lever. 2. With lock-out dog held tight against stop on flange casting and secondary throttle valves partially open there should be .020 inch (Gauge T109-29) betw én tang on secondary throttle lever and lock-out arm. To adjust, bend arm at slot on lock-out dog. NOTE: Fast idle cam may be rem ved to facilitate gauging and adjusting.

IDLE SPEED AND MIXTURE ADJUSTMENT (Normal Engin Temp): In making th idle adjustment n the engine, the air adjustment screw is used t adjust idle sp ed in a similar manner as the throttle speed screw used previously. Turning the air adjustment screw outward increases engin speeds, but also leans the mixtur supplied to the manifold which must b compensated for by adjustment of the idle mixture adjusting screws.

GENERAL BULLETIN

CARBURETER CONTRACT ACCOUNTS
FACTORY AND P.I. SCHOOL GRADUATES

BULLETIN NO. 13 PLYMOUTH
DATE December 9, 1957

SUBJECT: 1958 PLYMOUTH V8 FLAT ON ACCELERATION COMPLAINT BBD-2644S-45S-46S (DUAL) CARBURETERS

Vacuum step-up spring 61-549 has been found helpful in correcting a flat spot or lag in performance upon light or part throttle acceleration.

Vacuum step-up spring 61-549 (pink) is slightly stronger than the early production spring 61-538 (cadmium plated) and causes the step-up rods to move out of the main metering jets and the carbureter to deliver the power mixture more quickly upon acceleration.

Carbureters code dated "M7" (December 1957) or later have the 61-549 spring installed in production.

Plymouth dealers will rely on Carter accounts to supply the 61-549 springs. This is not a new part, however, to insure availability, a skeleton stock shipment is being made to Carter Central Distributors.

Carter warranty is not involved.

BBD Down-Draft Climatic® Control Carbs. Nos. 2644S-2645S-2646S

CARBURETER SPECIFICATIONS

For Plymouth 8 Cylinder 318 Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange size, 1¼ inch dual, 4 bolt type Throttle bore, 1-7/16 inch I D
Primary venturi 3/8 inch I D.
Main venturi, 1-3/16 inch I. D

Vent: Inside, balance vent tube to bowl, in air horn above choke valve Outside, (2) in flange above throttle valve

Low Speed Circuit: Jet (in venturi assembly) size 0255 inch diameter Idle bleed (in venturi cluster screw) size (2644S 2645S) 055 inch (2646S) 059 inch diameter Idle restriction (in venturi cluster screw) size 055 inch diameter Venturi idle bleed (in body) size 0472 inch diameter. Idle port, slot type length 189 inch, width 030 inch

Idle Port Opening: 144 to 148 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 055 inch diameter

Set Idle Adjustment Screw: ¼ to 1¼ turns open For richer mixture turn screw out With gear shift lever in neutral position idle engine at 500 R P M

Main Vent Tube: Side holes 10—size 0433 inch 1—size 0393 inch diameter Main vent in bottom of tube size 0393 inch diameter

Accelerating Pump: Pump discharge jets (2—in venturi cluster) size 0275 inch diameter Intake ball check seat size 130 to 140 inch diameter Discharge ball check seat size 110 to 120 inch diameter

Choke: Carter Climatic® Control Cross Over Type, set at index Butterfly type offset valve Choke heat suction hole in air horn size No 44 (086 inch) drill

Vacuum Spark Port: Horizontal round end type 045 by 110 inch Top of port to be 025 to 035 inch above upper edge of valve with valve closed tight

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open: 10° B. T. D. C. At Vibration Damper	Valve Setting (Hot) Intake .008" Exhaust .018"	Float Setting 9/32 Inch (Use Gauge T109-239)	Idle Adjustment Screw Setting ¼ to 1¼ Turns Open Idle Engine at 500 R. P. M. In Neutral

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3656

Float Level: 9/32 inch (Gauge T109 239) between top of each float ridge (at center of float) and top surface of body casting To adjust bend lip on float arm

Pump: 1-1/32 inch from the top of the bowl cover to the top of the plunger shaft Install throttle connector rod in center hole (medium stroke) of throttle lever and inner hole of pump arm To adjust bend throttle connector rod

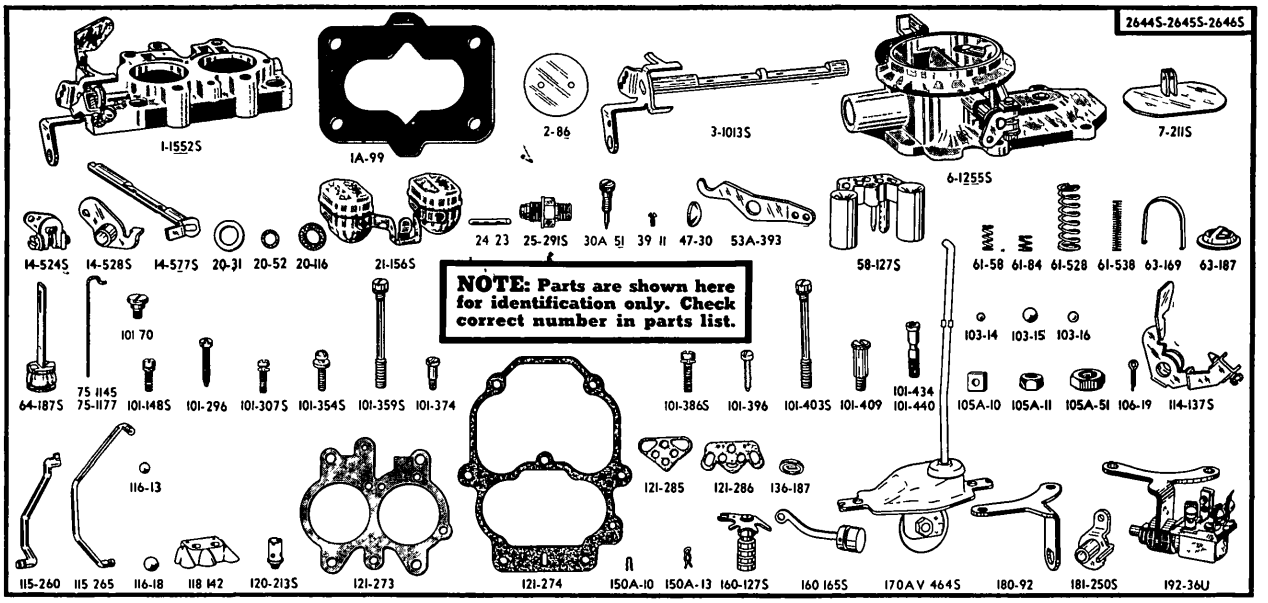
Fast Idle Cam Clearance: With choke valve closed and lip on inner choke shaft lever contacting lug on outer lever, align index mark with adjusting screw To adjust bend lip on inner choke shaft lever

Fast Idle Throttle Valve Clearance: 015 (Gauge T109-44) between lower edge of valve and bore with adjusting screw on index mark of cam

Fast Idle on Car: 1400 R P M hot engine with fast idle screw on index mark of cam

Unloader: ¼ inch (Gauge T109-31) between top edge of choke valve and inner wall of air horn with throttle valves wide open To adjust bend unloader arm on throttle lever

Overdrive Kickdown Switch: With throttle valves wide open there should be 1/64 inch to 3/64 inch between kickdown lever and switch stem guide To adjust loosen lock nuts and adjust switch



Choke Adjustment (Cross Over Type) See Form 3657: I Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed under carbureter specifications Hold in this position with screw

driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of the hole in housing cover. If rod does not clear hole in housing cover without binding, replace with a new unit since connector rod cannot be bent without effecting calibration.

AFB Four-Bore Down-Draft Climatic® Control Carbureters Nos. 2641S-2744S

CARBURETER SPECIFICATIONS

For Plymouth 8 Cylinder 318 Cu. In. Engine: Vacuum at Idle 19.5 Inches

Dimensions: Flange four bore—4 bolt type
Throttle bore 1 7/16 inch
Primary venturi size, primary side 7/16 inch secondary side (2641S) 11/32 inch, (2744S) 7/16 inch I D
Main venturi size 1 3/16 inch

Vents: Inside (4) in air horn Outside (4) in body, (5) in air horn

Low Speed Circuit: (Primary side only)
Jet size (2641S) No 68 (031 inch) (2744S) No 66 (033 inch) drill
By pass size (0492 inch) diameter
Economizer size (0452 inch) diameter
Idle bleed, size (0492 inch) diameter
Idle port slot type length 198 inch width 030 inch

Idle Port Opening: 142 to 148 inch above top edge of valve with valve tightly closed

Set Idle Adjustment Screw: 1/4 to 1 3/4 turns open For richer mixture turn screw out Do not idle engine below 500 r p m Transmission in neutral

Main Nozzle: Install permanently DO NOT REMOVE Anti percolator bleed, primary (tube in venturi assembly) size No 68 (031 inch) drill Secondary (drilled hole in venturi assembly) size No 60 (040 inch) drill

Main Vent Tube. (In venturi assembly) Side holes primary side 11—size No 70 (028 inch) 1—size No 65 (035 inch) drill secondary side (2641S) 2—size No 57 (043 inch) 1—size No 70 (028 inch) (2744S) 11—size No 70 (028 inch) drill

Accelerating Pump: Discharge jet (twin) primary side only size No 70 (028 inch) drill Intake ball check seat (screw plug) size 115 to 120 inch diameter Discharge needle seat size No 50 (070 inch) drill

Choke: Carter Climatic® Control Cross over type set 2 points rich Butterfly type offset valve primary side only Choke heat suction hole in air horn size No 44 (086 inch) drill

Vacuum Spark Port: Slot type (round end) 045 x 110 inch Top of port 026 to 034 inch above top edge of valve with valve tightly closed

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3734

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: (2641S) (With 21-188S floats) 5/16 inch (gauge T109-107) (with 21-179S floats) 7/32 inch (gauge T109-106). (2744S) (with 21-188S floats) 1/4 inch (gauge T109-31), with 21-179S floats 7/32 inch (gauge T109-106) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever. **NOTE:** Identify 21-188S floats by smooth sides, 21-179S by ribs on floats.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 7/16 inch from top of the bowl cover to the top of the plunger shaft with throttle connector rod in center hole (medium stroke) of pump arm. To adjust, bend throttle connector rod.

FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

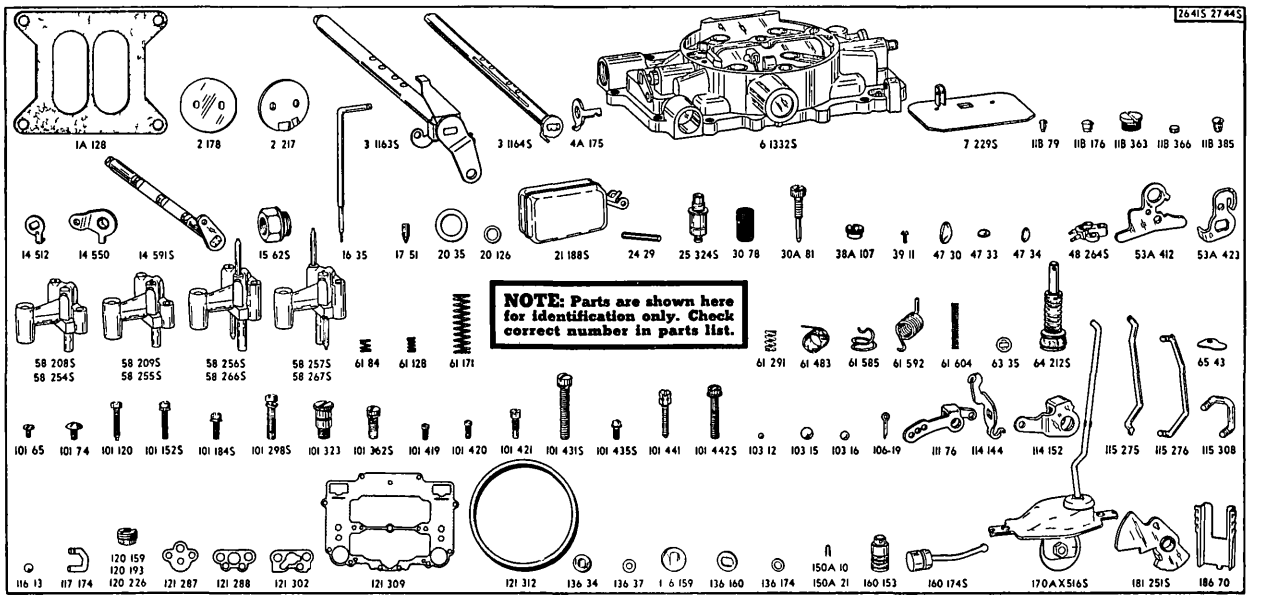
FAST IDLE THROTTLE VALVE CLEARANCE: .012 inch (gauge T109-200) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 1400 R. P. M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/4 inch (gauge T109-31) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Block choke valve wide open. 2. With 3/8 inch between lower edge of primary valve and bore (opposite idle port) secondary valves should just start to open. To adjust, bend throttle operating rod. NOTE: At wide open throttle primary and secondary valves will reach full vertical position. 3. With primary and secondary throttle valves in tightly closed position there should be .010" to .030" (gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.



CHOKE ADJUSTMENT (CROSS OVER TYPE) SEE FORM 3657: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

TOOLS REQUIRED FOR SERVICING CARBURETERS:

CARTER MODEL AFB CARBURETER FOR PLYMOUTH (SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the base of the carbureter, when requesting specification pages.

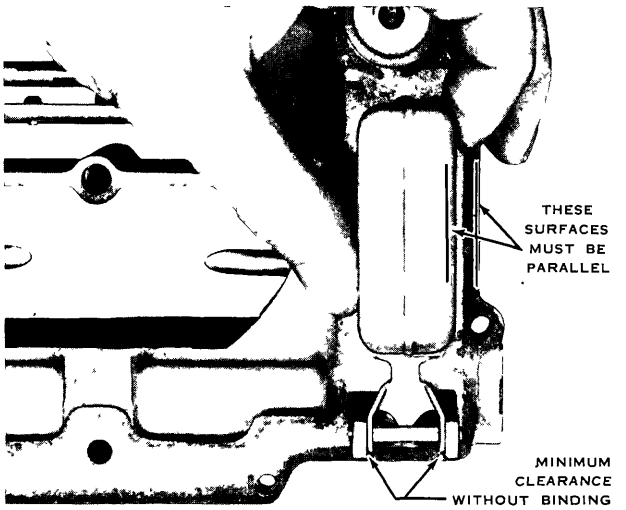

Figure 1

FLOAT ALIGNMENT ADJUSTMENT (Fig. 1):

1. Sight down the side of the float shell to determine if the side of the float is parallel to the outer edge of the air horn casting. TO ADJUST: Bend float lever by applying pressure to the end of the float shell with the fingers while supporting the float lever with the thumb.

   CAUTION: To avoid damaging the float, apply only enough pressure to bend float lever.

2. After aligning float, remove as much clearance as possible between arms of float lever and lugs on air horn by bending the float lever. Arms of float lever should be as parallel to the inner surfaces of lugs on air horn as possible.

   Floats must operate freely without excess clearance on its hinge pin.

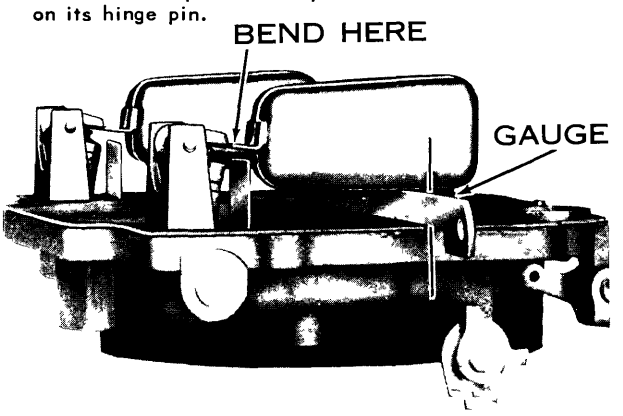

Figure 2

FLOAT LEVEL ADJUSTMENT (Fig. 2):

With air horn inverted, bowl cover gasket in place and n edl s ated, the clearance betwe n t p of float (at outer nd) and air horn gasket should be as listed on carbureter specification page. To adjust, bend float arm. Adjust both floats. Recheck fl at alignment.

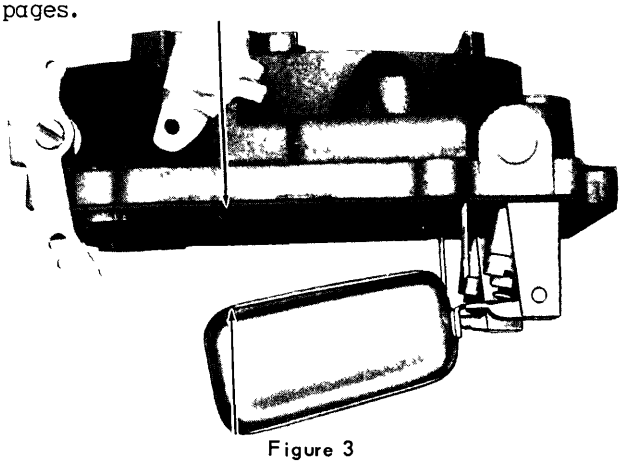

Figure 3

FLOAT DROP ADJUSTMENT (Fig. 3):

With bowl cover held in upright position and measuring from outer end of each float, the distance between top of floats and bowl cover gasket should be as listed on carbureter specification page. To adjust, bend stop tabs on float brackets.

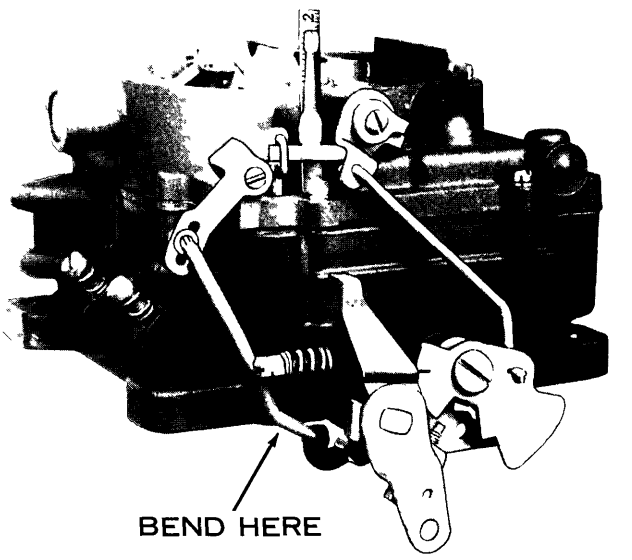

Figure 4

PUMP ADJUSTMENT (Fig. 4):

1. Back out idle speed screw until thr ttle valv s seat in bores of carbureter. NOTE: Be sure fast idle adjusting screw does not contact fast idle cam and h ld throttle valves open.
2. With throttle connector rod in center hole (medium strok) of pump arm, the distance from the top of th bowl cover to th top of the plunger shaft should be as listed n carbureter sp cification page.
3. Adjust by b nding throttle connector rod at lower angle (use tool T109-213).

Copyright © 1957
by ACF Industries, Incorporated
All Rights Reserved

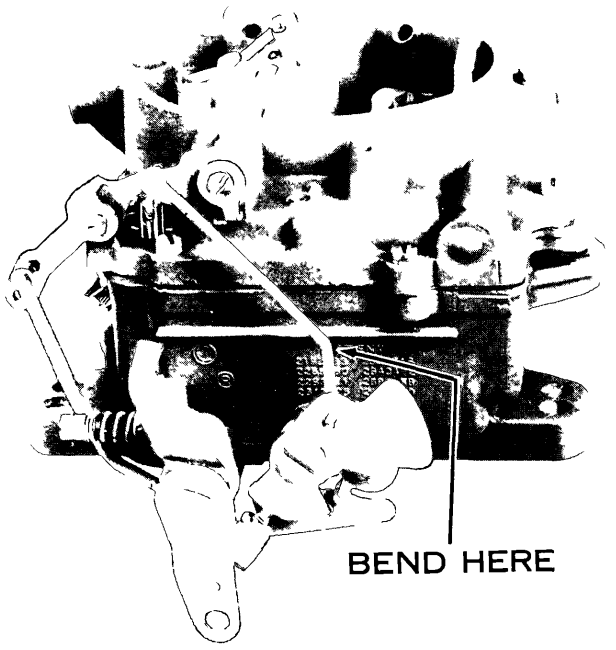

Figure 5

FAST IDLE LINKAGE ADJUSTMENT (Fig. 5):

With choke valv tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align cent r of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod. (Use tool T109-213.)

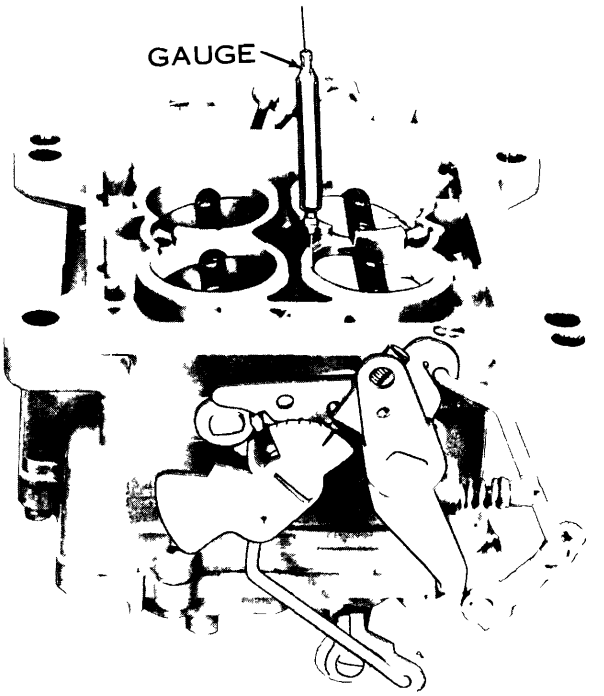

Figure 6

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 6):

With choke valve tightly closed, tighten fast idle adjusting screw (on index mark of cam) until the clearance between throttle valve and bore of carbureter, side opposite idle port, is as listed on carbureter specification page.

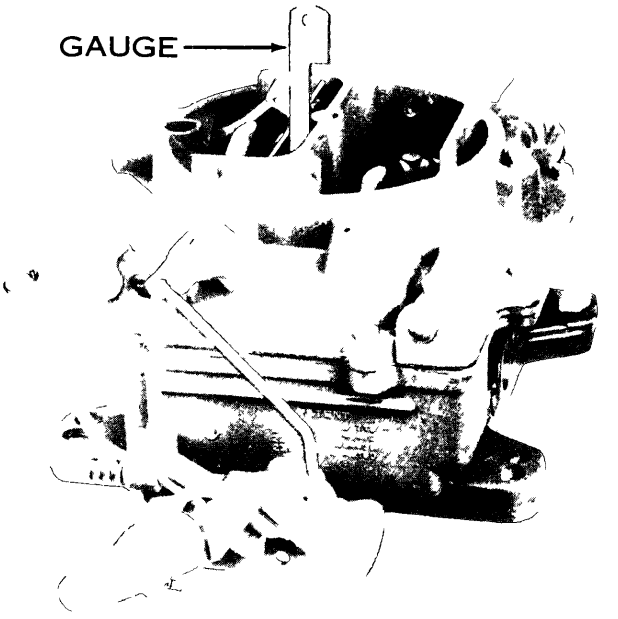

Figure 7

UNLOADER ADJUSTMENT (Fig. 7):

With throttl wide open, th clearance between upper dge of choke valve and inn r wall of air h rn should be as listed on carbureter specification page. To adjust, bend unload r lip on throttle shaft lever. (Use to l T109-41.)

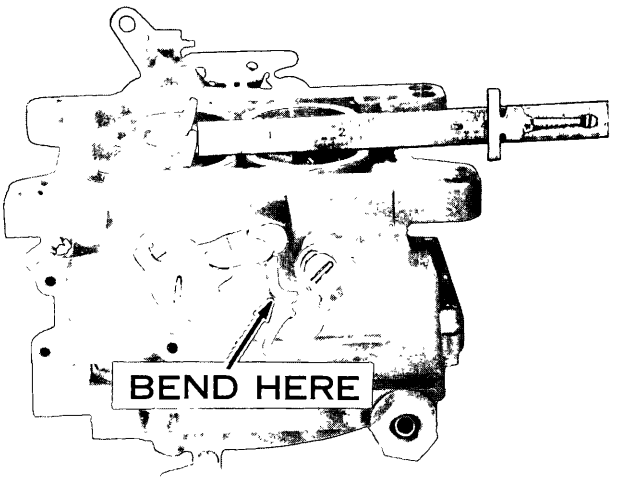

Figure 8A

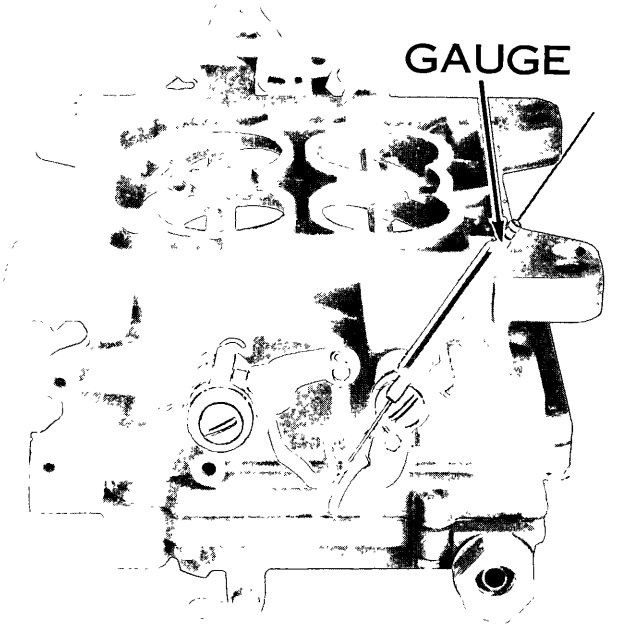

Figure 8B

SECONDARY THROTTLE LEVER ADJUSTMENT (Figs. 8A & 8B):

1. Block choke valve wide open.
2. Secondary throttle valves should just start to open when primary throttle valves are opened to the clearance as listed on specification page between lower edge of valve and bore (opposite idle port). To adjust, bend throttle operating rod. (Use bending tool T109-213). (See Fig. 8A) NOTE: Primary and secondary throttle valves should reach wide open position, full vertical, at the same tim .
3. With primary and s condary throttle valves in tightly clos d position, there should be the clearance as listed n specification page between positive closing shoes on primary and secondary throttle l vers. To adjust, bend sho on sec ndary lev r. (See Fig. 8B)

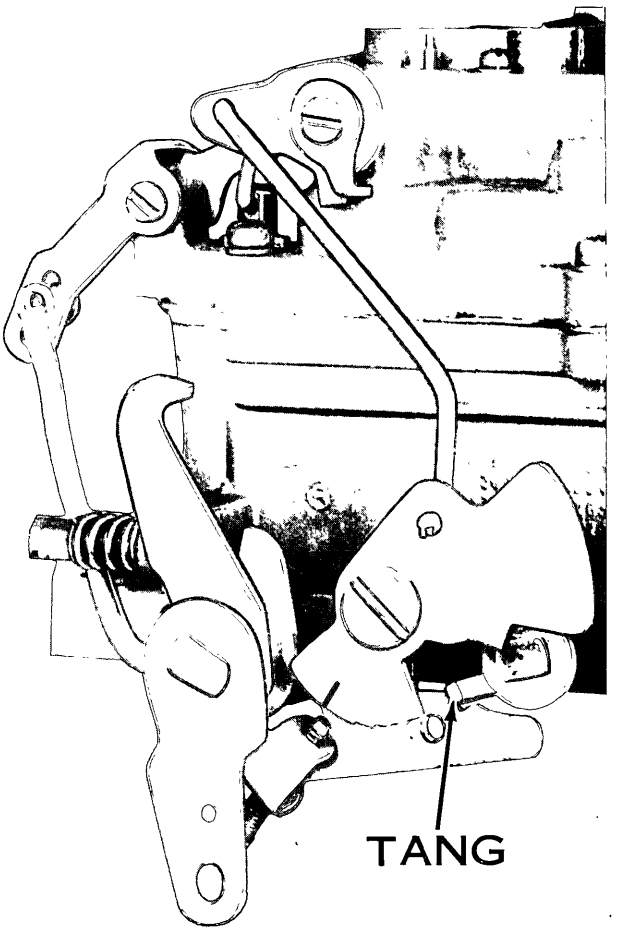

Figure 9

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 9):

Crack throttle valves and manually open and clos the choke valve. Tang on secondary throttle lever sh uld freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lev r.

NOTE: See last page for pertinent service information.

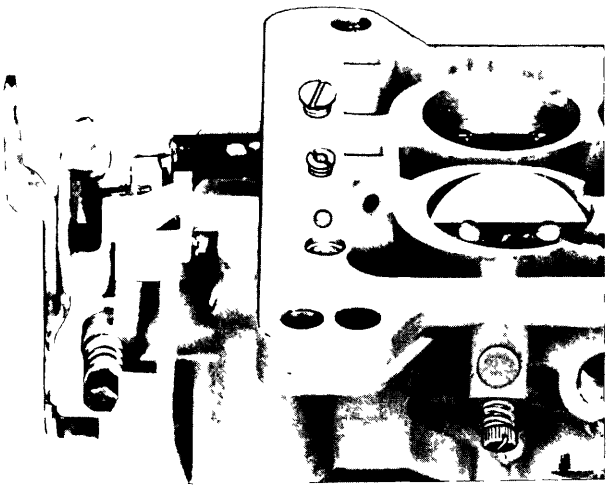

Figure 10

(Fig. 10):

Pump intake check ball, seat and screw plug are removed by inverting carbureter and removing from lower side of flange.

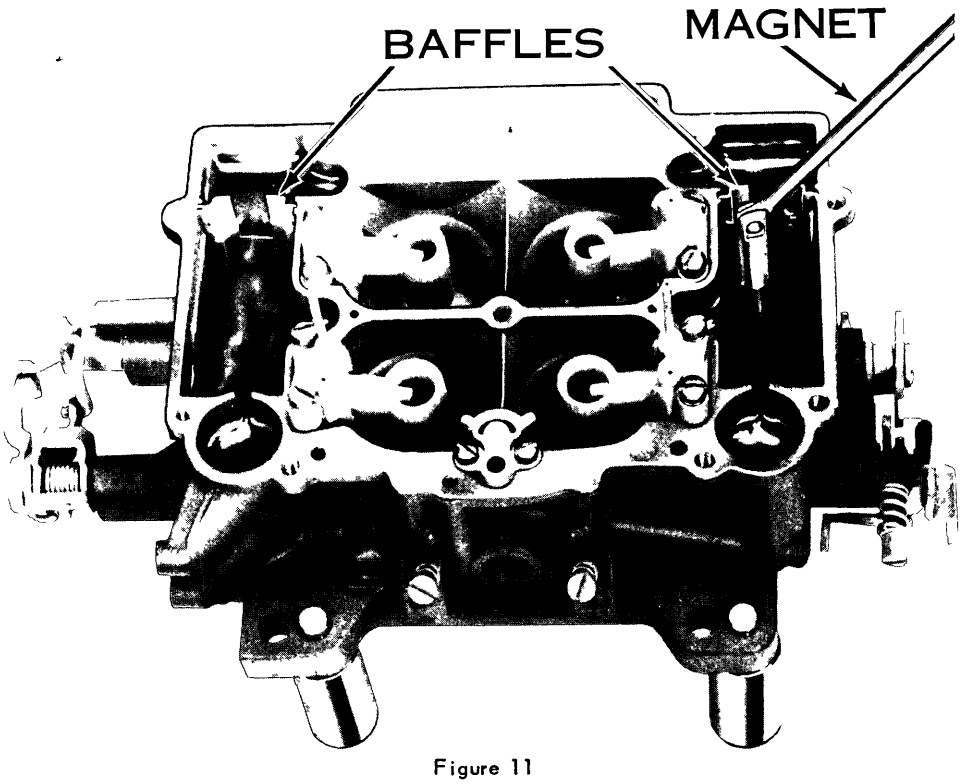

Figure 11

(Fig. 11):

Flooding, stumble on acceleration and other performance complaints are, in many instances, caused by the presence of dirt, water or other foreign matter in the carbureter. To aid in diagnosing the cause of the complaint, the carbureter should be carefully removed from the engine without draining the fuel from the bowl. The contents of the fuel bowl may then be examin d for contamination as the carbureter is disassembled.

Check the fuel in the bowl for contamination by dirt, water, gum or other foreign matter. A magnet moved through the fuel in the bowl will pick up and identify any iron oxide dust that may have caused intake needle and seat leakage.

Insp ct gasketed surfaces between body and air horn. Small nicks or burrs should be smoothed down to eliminate air or fuel leakage. Be especially particular when inspecting the top surface of the inner wall of the bowl around the vacuum piston passage. A poor seal at this location may contribute to a "cutting-out" on turns complaint.

Install fuel baffles as shown (Fig. 11) to prevent damage to floats. Use caution when installing air horn assembly. Baffles on air horn assembly must fit inside of fuel bowl baffles toward primary side of carbureter.

Fill the carbureter bowl with clean fuel before installing on the manifold. This will help prevent dirt trapped in the fuel system from being dislodged by the free flow of fuel as the carburetor is primed. The operation of the floats and intake needle and seats may be checked under pressure if a fuel pump is used at the bench to fill the carbureter bowl. Operate the throttle several times and visually check the discharge from the pump jets.

Before installing the carbureter, hold choke valve open and turn the idle speed screw until it just contacts the throttle lever, then 1/2 a turn more to open the throttle valves enough to keep the engine running until the idle mixture and final R.P.M. adjustment can be made.

CARBURETER
TRADE MARK REG U. S. PAT. OFF.
MARCA REGISTRADA

S S PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 7/32" (gauge T109-283) for primary floats; and 9/32" (gauge T109-284) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of floats, the distance between top of floats and bowl cover should be 23/32" for primary floats and 25/32" for secondary floats. Adjust by bending stop tabs on float bracket.

PUMP ADJUSTMENT: Install pump connector link in center hole (medium stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

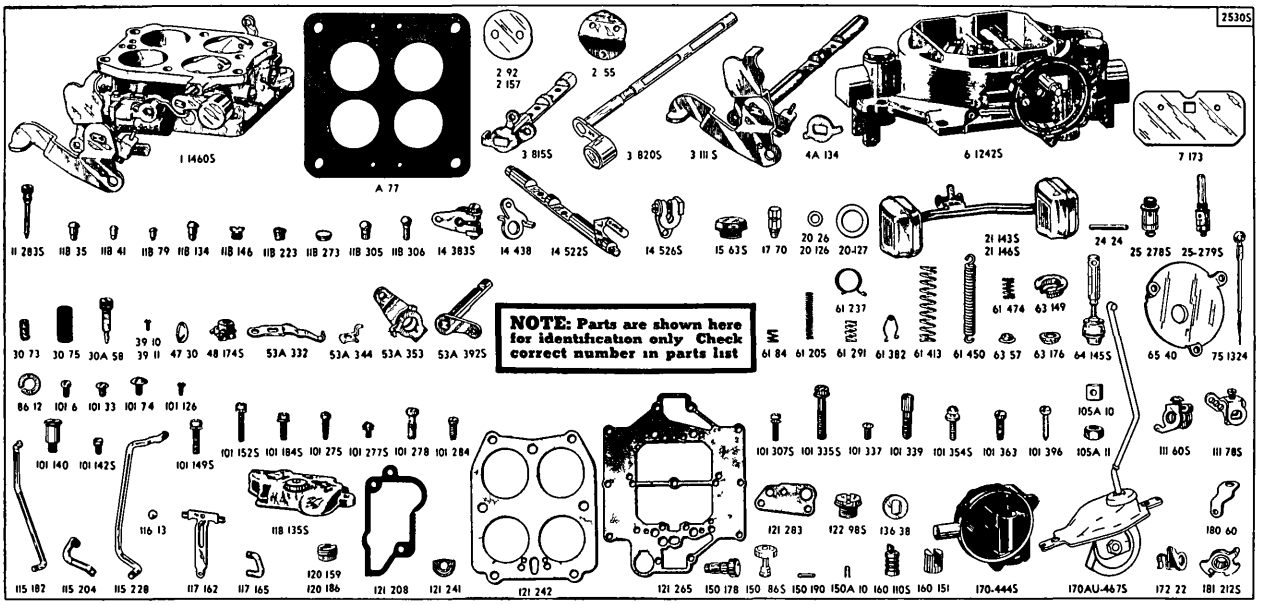
METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020" feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .010" (gauge T109-200) opening between throttle valve and bore of carbureter (side opposite idle port). Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

FAST IDLE ON CAR: 1350 to 1400 R.P.M., hot engine with fast idle screw on high step of cam.

UNLOADER ADJUSTMENT: With throttle wide open there should be 11/64" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-166). Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).



AUXILIARY THROTTLE VALVE ADJUSTMENT: (a) Disconnect secondary throttle operating rod. (b) Adjust stop lug on secondary throttle lever (use bending tool T109-214) until there is 27/64" clearance (gauge T109-242) between lower edge of auxiliary throttle valve and bore, when lug is against stop on flange.

SECONDARY THROTTLE LEVER ADJUSTMENT: The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust bend secondary throttle operating rod at angle (use bending tool T109-213).

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle adjustment. 1. With choke valve closed, edge of hook on lockout arm should contact auxiliary throttle lever, making maximum contact of locking step on lever. 2. Open choke valve. Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position. Adjust by bending lockout arm.

CHOKE ADJUSTMENT (CROSS OVER TYPE) See Form 3657: 1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. **NOTE:** Screw driver may be held in vise so that one hand may be used to support housing while tightening nut. 2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration.

Use 2512SC to replace 2514S-SA-SB-SC

BBD Dual Down-Draft Climatic® Control Carbureters Nos. 2512S-SA-SB-SC, 2513 S-SA-SB-SC, 2514S-SA-SB-SC

CARBURETER SPECIFICATIONS

For Plymouth 8 Cylinder Engine: 3.91 Inch Bore, 3.125 Inch Stroke (301 Cu. In. Eng.) Belvedere, Savoy and (late) Plaza.
For Plymouth 8 Cylinder Engines: 3.75 Inch Bore, 3.13 Inch Stroke (277 Cu. In. Eng.) (early) Plaza.

Dimensions: Flange size, 1¼ inch dual, 4 bolt type Throttle bore, 1-7/16 inch I D
Primary venturi, ⅜ inch I D.
Main venturi, 1-3/16 inch I D.

Vent. Inside, balance vent tube to bowl, in air horn above choke valve Outside, (late prod) (2) No 36 (1065 inch) in flange above throttle valve

Gasoline Intake: Size No 38 (1015 inch) drill hole in needle seat.

Idle Tube: Jet (in venturi assembly 58-155S) size 0275 inch diameter, (58-127S) size 0255 inch diameter. Idle bleed (in venturi cluster screw 101-433) size 0472 inch diameter, (101-434) size 055 inch diameter, (101-440) size 059 inch diameter, (101-448) size 0649 inch diameter. Idle restriction (in venturi cluster screw) size 055 inch diameter.
Venturi idle bleed (in body) size 0472 inch diameter Models S SA-SB have idle passage through top of venturi cluster, Models SC have diagonal passage to screw hole.

Idle Port Upper, slot type, length 189 inch; width, 030 inch

Idle Port Opening 144 to 148 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 053 to 057 inch diameter.

Set Idle Adjustment Screw: ¼ to 1¼ turns open For richer mixture, turn screw out With gear shift lever in neutral position idle engine between 450 and 500 RPM

Main Nozzle· Nozzle is installed permanently. DO NOT REMOVE

Main Vent Tube: Side holes 10—size 0433 inch, 1—size 0393 inch diameter Main vent in bottom of tube, size 0393 inch diameter

Step-Up Rod: (Vacuum operated) See parts list for size.

Metering Jet See parts list for calibrated flow per minute

Accelerating Pump Pump discharge jets (2—in venturi cluster) size 0275 inch diameter Intake ball check seat, size 130 to 140 inch diameter Discharge ball check seat, size 110 to 120 inch diameter

Choke· Carter Climatic® Control Cross Over Type, set at index Butterfly type offset valve Choke heat suction hole, in air horn size No 44 (086 inch) drill.

Vacuum Spark Port: Horizontal round end type (early prod) 030 by 110 inch (late prod) 045 by 110 inch Top of port to be (early prod) 035 to 045 inch, (late prod) 025 to 035 inch above upper edge of valve with valve closed tight

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3656

Float Level. 9/32" (Gauge T109-239) between top of each float ridge (at center of float) and top surface of body casting To adjust bend lip on float arm

Pump. 1-1/32" from the top of the bowl cover to the top of the plunger shaft Install throttle connector rod in center hole (medium stroke) of throttle lever and inner hole of pump arm To adjust bend throttle connector rod

Fast Idle Cam Clearance: With choke valve closed and lip on inner choke shaft lever contacting lug on outer lever, align index mark with adjusting screw To adjust bend lip on inner choke shaft lever

Fast Idle Throttle Valve Clearance: 020" (Gauge T109-29) between lower edge of valve and bore with adjusting screw on index mark of cam

Fast Idle on Car: 1450 to 1500 R.P.M.

Unloader: ¼" (Gauge T109-31) between top edge of choke valve and inner wall of air horn with throttle valves wide open To adjust bend unloader arm on throttle lever.

Overdrive Kickdown Switch: With throttle valves wide open there should be 1/64" to 3/64" between kickdown lever and switch stem guide To adjust loosen lock nuts and adjust switch

Choke Adjustment (Cross Over Type) See Form 3657: I Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed under carbureter specifications Hold in this position with screw driver and tighten lock nut NOTE Screw driver may be held

BBS Down-Draft Climatic® Control **Carbs. Nos. 2567S-2568S-2569S-2604S**

CARBURETER SPECIFICATIONS

For Plymouth Six Cylinder Engine 3 25 Inch Bore 4 63 Inch Stroke

Dimensions Flange size 1½ inch S A E Throttle bore 1 11/16 inch Main venturi 1 11/32 inch I D

Vents Outside none Inside balance vent tube

Gasoline Intake Size No 44 (086 inch) drill in needle seat

Idle Tube Jet size 0315 inch diameter Idle passage air bleed in body size 061 inch diameter Restriction in body size 057 inch diameter

Idle Port Upper slot type length 195 inch width 030 inch

Idle Port Opening Top of port located 140 to 144 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw) Size 053 to 057 inch diameter

Set Idle Adjustment Screw ½ to 1¾ turns open For richer mixture turn screw out Idle engine between 450 500 r p m gear shift lever in neutral

Main Metering Jet Calibrated to flow 406 cc per minute (Do not gauge for size if in doubt replace with new part)

Main Vent Tube Side holes 6—0354 inch diameter Bleed in top of tube 0236 inch diameter

Step-Up Rod (Vacuum operated) (75 943) size 024 inch (75 1225) size 022 inch diameter

Accelerating Pump Pump intake passage ball check seat size 110 to 120 inch diameter Pump discharge passage ball check seat 110 to 120 inch diameter in body Pump (discharge) jet size 0276 inch drill Bleed hole in pump plunger plate size 020 inch diameter

Choke Carter Climatic® Control set on index Choke heat suction hole in body size No 38 1015 inch) drill NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermostatic coil and housing assembly

Vacuum Spark Port Slot (round end) type Size 030 by 110 inch Top of port 044 to 050 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap .035"	Breaker Point Setting .020"	Ignition Timing Breaker Points to Open T D C (1957) 2° B T C (1958) At Vibration Damper	Valve Setting (Hot) Intake 010" Exhaust .010"	Float Setting 7/32 Inch (Use Gauge T109-239)	Idle Adjustment Screw Setting ½ to 1¾ Turns Open Idle Engine at 450 to 500 R P M. In Neutral

CARBURETER ADJUSTMENTS

Float Adjustment This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109 239) If one float is lower than the other equalize by bending the float arm If both floats require the same correction adjust by bending lip on float arm The floats must not rub anywhere against the inner walls of the bowl If necessary bend float arms slightly to provide clearance on all sides of floats

Pump Adjustment Back out throttle adjusting screw and open choke valve so that throttle valve seats in bore of carbureter Install throttle connector rod in center hole of throttle lever The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 54/64 inch Adjust by bending throttle connector rod at lower angle (use Tool T109 213)

Fast Idle Adjustment Remove thermostatic coil housing assembly gasket and baffle plate With throttle adjusting screw backed out crack throttle valve and hold choke valve in fully closed position Then close throttle This will allow fast idle cam to revolve to fast idle position There should now be 016 020 inch clearance (use gauge T109 44) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle (use Tool T109 213)

Caution Be sure cam trip lever is all the way in piston housing with lug contacting cam

Fast Idle on Car 1600 to 1700 R P M hot engine with choke trip lever on high step of cam

Unloader Adjustment This adjustment must be made after the fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing There should now be 9/64 inch clearance (use gauge T109 34) between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever (use tool T109 214) When fast idle and unloader adjustments have been made

assemble baffle plate coil housing gasket and thermostatic coil housing assembly on air horn Set Climatic® Control as specified making sure that hook on coil has picked up coil shaft lever

Overdrive Kickdown Switch Adjustment With throttle valve in wide open position adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance between kickdown lever and switch stem guide

Dashpot (Slow Closing Throttle) Adjustment The purpose of the dashpot is to prevent the car from stalling when the throttle is released rapidly Maximum dashpot action is obtained by loosening lock nut and adjusting the dashpot unit so that the dashpot plunger shaft can be moved inward approximately 3/32 inch with the throttle valve tightly closed Then tighten lock nut

Plymouth—1957-1958—Carbureters Nos. 2567S-2568S-2569S-2604S

WHEN SERVICING, USE GASKET ASSORTMENT No 252, RE-CARBURETION KIT No 1817N

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical **LATERAL ADJUSTMENT** With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats **VERTICAL ADJUSTMENT** With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting must be 7/32" (gauge T109 283) for primary floats and 9/32" (gauge T109 284) for secondary floats Adjust by bending float arms

FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of floats the distance be tween top of floats and bowl cover should be 23/32" for pri mary floats and 25/32" for secondary floats Adjust by bending stop tabs on float bracket

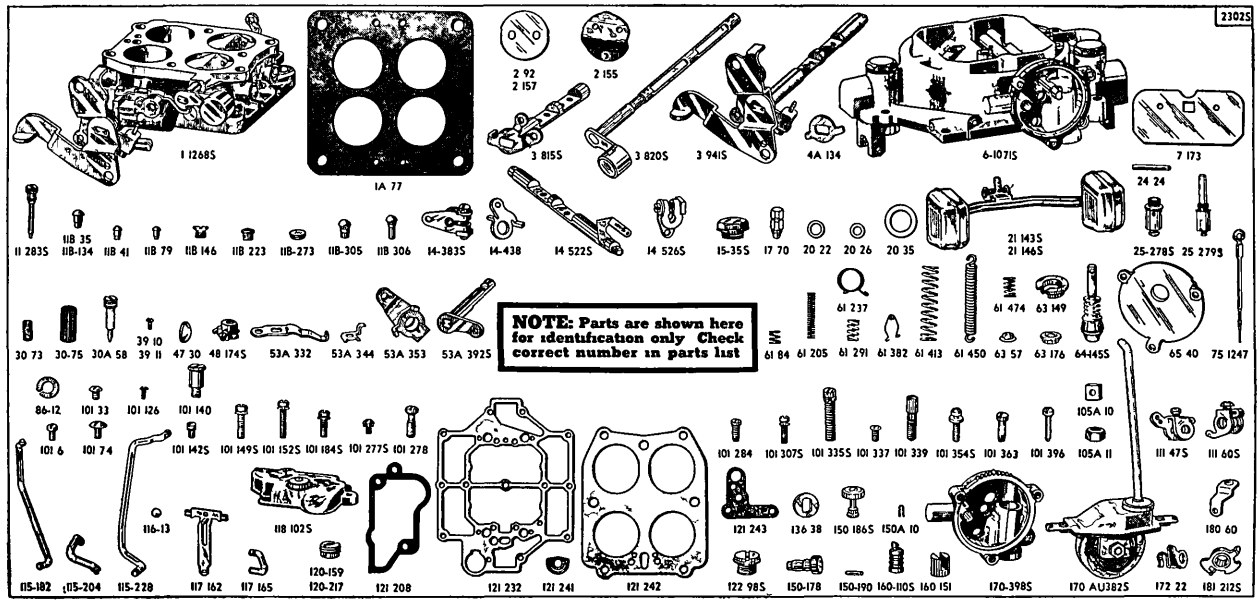
PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward coun tershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod (early) at upper angle (late) at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump adjust ment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109 197) be tween lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

FAST IDLE ADJUSTMENT (a) Loosen choke lever clamp screw on choke shaft Insert 020" feeler gauge (T109 29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed tighten fast idle adjusting screw until there is 015" (gauge T109 44) opening between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment

UNLOADER ADJUSTMENT With throttle wide open there should be 11/64" clearance between upper edge of choke valve and inner wall of air horn (gauge T109 166) Adjust by bend ing unloader lip on throttle shaft lever (use bending tool T109 41)



AUXILIARY THROTTLE VALVE ADJUSTMENT (a) Disconnect secondary throttle operating rod (b) Adjust stop lug on sec ondary throttle lever (use bending tool T109 214) until there is 27/64" clearance (gauge T109 242) between lower edge of auxiliary throttle valve and bore when lug is against stop on flange

SECONDARY THROTTLE LEVER ADJUSTMENT The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time To adjust bend secondary throttle operating rod at angle (use bending tool T109 213)

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT This ad justment should be made after completing fast idle adjustment 1 With choke valve closed edge of hook on lockout arm should contact auxiliary throttle lever making maximum contact of locking step on lever 2 Open choke valve Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position Adjust by bending lockout arm

CHOKE ADJUSTMENT (CROSS OVER TYPE) See Form 3657 1 Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page Hold in this position with screw driver and tighten lock nut **NOTE** Screw driver may be held in vise so that one hand may be used to support housing while tightening nut 2 After adjustment is completed and coil hous ing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration

BBS Down-Draft Climatic® Control **Carbureters Nos. 2410S-2771S**

CARBURETER SPECIFICATIONS

For Plymouth Six Cylinder Engine 3 25 Inch Bore, 4 63 Inch Stroke

Dimensions Flange size 1½ inch S A E Throttle bore 1 11/16 inch Main venturi 1 11/32 inch I D

Vents Outside none Inside balance vent tube

Gasoline Intake Size No 44 (086 inch) drill in needle seat

Idle Tube Jet size 028 inch diameter Idle passage air bleed in body size 061 inch diameter Restriction in body size 057 inch diameter

Idle Port Upper slot type length 195 inch width 030 inch

Idle Port Opening Top of port located 140 to 144 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw) Size 053 to 057 inch diameter

Set Idle Adjustment Screw 1 to 2 turns open For richer mixture turn screw out Idle engine between 450 500 r p m gear shift in neutral

Main Metering Jet Calibrated to flow 378 to 386 cc per minute (Do not gauge for size if in doubt replace with new part)

Main Vent Tube Side holes 6— 0354 inch diameter Bleed in top of tube 0236 inch diameter

Step Up Rod (Vaccum operated) size 020 inch diameter

Accelerating Pump Pump intake passage ball check seat size 110 to 120 inch diameter Pump discharge passage ball check seat 110 to 120 inch diameter in body Pump (discharge) jet size 0276 inch drill Bleed hole in pump plunger plate size 020 inch diameter

Choke Carter Climatic® Control set on index Choke heat suction hole in body size No 38 (1015 inch) drill
NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermostatic coil and housing assembly

Vacuum Spark Port Slot (round end) type Size 030 by 110 inch Top of port 044 to 050 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of each float should be 9/32 inch (gauge T109-239) If one float is lower than the other, equalize by bending the float arm If both floats require the same correction adjust by bending lip on float arm The floats must not rub anywhere against the inner walls of the bowl If necessary bend float arms slightly to provide clearance on all sides of floats

PUMP ADJUSTMENT Back out throttle adjusting screw and open choke valve so that throttle valve seats in bore of carbureter Install throttle connector rod in center hole of throttle lever The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 54/64 inch Adjust by bending throttle connector rod at lower angle (use Tool T109-213)

FAST IDLE ADJUSTMENT Remove thermostatic coil housing assembly, gasket and baffle plate With throttle adjusting screw backed out crack throttle valve and hold choke valve in fully closed position Then close throttle This will allow fast idle cam to revolve to fast idle position There should now be 016-020 inch clearance (use gauge T109 44) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle (use Tool T109-213)

CAUTION Be sure cam trip lever is all the way in piston housing with lug contacting cam

UNLOADER ADJUSTMENT This adjustment must be made after the fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing There should now be 9/64 inch clearance (use gauge T109-34) between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever (use tool T109-214) When fast idle and unloader adjustments have been made assemble baffle plate coil housing gasket and thermostatic coil housing assembly on air horn Set Climatic® Control as specified making sure that hook on coil has picked up coil shaft lever

Plymouth—1956-1958—Carbureters Nos. 2410S-2771S

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2442S**

CARBURETER SPECIFICATIONS

For Plymouth 8 Cylinder Engine 3.81 Inch Bore, 3.31 Inch Stroke

Dimensions Flange size 1¼ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi size 1 3/16 inch I D

Vents 4 combination nside and outside (1) angular inside

Gasoline Intake Size No 42 (0935 inch) drill in needle seat

Low Speed Jet Tube Jet size (035 inch) diameter By pass in body size (057 inch) diameter Economizer plug in body size No 56 (0465 inch) drill Idle bleed in body size No 46 (081 inch) drill

Idle Port Upper slot type primary length 140 inch width 030 inch Secondary length 103 inch width 030 inch

Idle Port Opening Primary 092 to 098 inch secondary 065 to 071 inch above top edge of valve with valve tightly closed

Lower Port Primary (for idle adjustment screw) size No 53 (0595 inch) drill Secondary (no idle adjustment screw) size No 57 (043 inch) drill

Set Idle Adjustment Screw 1 to 2 turns open For richer mixture turn screw out Do not idle engine below 450 to 500 R P M in neutral

Main Nozzle Installed permanently DO NOT REMOVE Anti percolating jet (4) size No 70 (028 inch) drill

Metering Rod Primary, Economy step 077 inch diameter Middle step tapers to 068 inch diameter Power step 052 inch diameter Secondary, none

Metering Rod Jet Primary Size 1015 inch diameter Secondary Size 073 inch diameter

Accelerating Pump. Discharge jet (twin) primary side only size No 74 (0225 inch) drill Intake ball check seat, size 115 to 120 inch diameter Discharge needle seat size No 50 (070 inch) drill Relief passage (vent) to fuel chamber size No 42 (0935 inch) drill

Choke Carter Climatic® Control Cross Over Type set on index Butterfly type offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 40 (098 inch) drill

Vacuum Spark Port Horizontal slot (round end) 045 x 110 inch Top of port 022 to 032 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

Spark Plug Gap .035"	Breaker Point Setting .017"	Ignition Timing Breaker Points to Open 4° B T C. At Vibrati n Damper	Valve Setting (Hot) Intake .010" Exhaust .018"	Float Setting Primary 7/32 Inch (Use Gauge T109-283) Secondary 9/32 Inch (Use Gauge T109-284)	Idle Adjustment Screw Setting 1 to 2 Turns Open Idle Engine at 450 to 500 R P.M In Neutral

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical **LATERAL ADJUSTMENT**· With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats **VERTICAL ADJUSTMENT** With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting must be 7/32" (gauge T109 283) for primary floats and 9/32" (gauge T109 284) for secondary floats Adjust by bending float arms

FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of floats, the distance be tween top of floats and bowl cover should be 23/32" for pri mary floats and 25/32" for secondary floats Adjust by bend ing stop tabs on float bracket

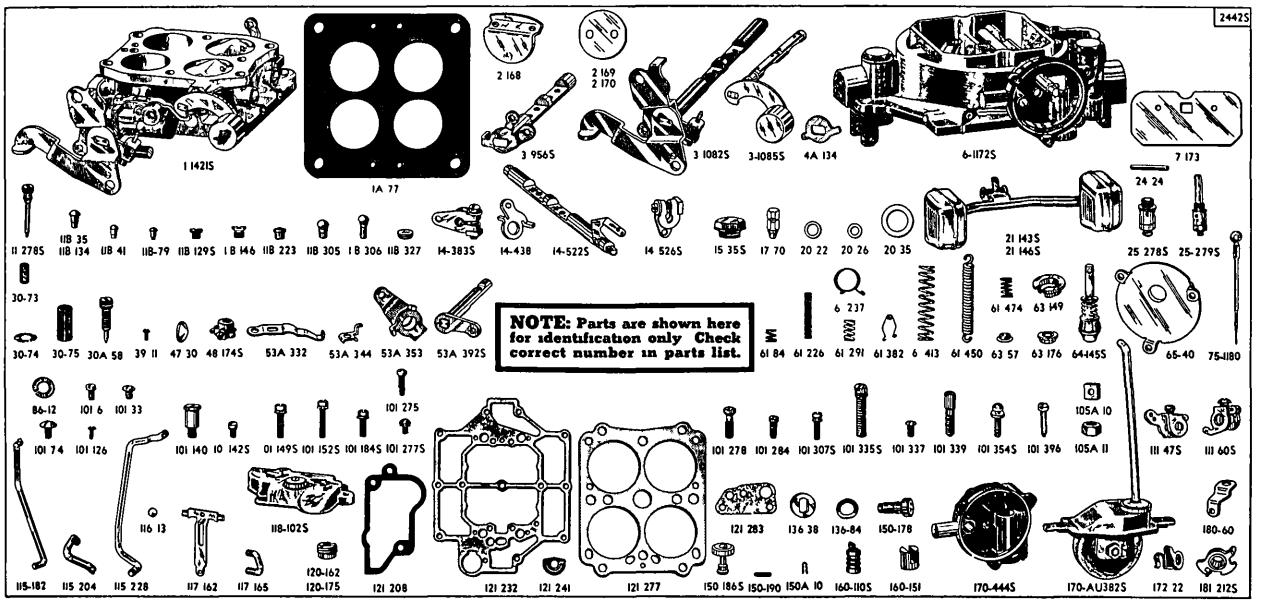
PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod (early) at upper angle (late) at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump ad justment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throt tle valves seated revolve metering rod arm unt l finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109 197) be tween lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm

FAST IDLE ADJUSTMENT (a) Loosen choke lever clamp screw on choke shaft Insert 020" feeler gauge (T109 29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed tighten fast idle adjusting screw until there is 012" (gauge T109 200) opening between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment

FAST IDLE ON CAR 1350 to 1400 R P M



UNLOADER ADJUSTMENT With throttle wide open there should be 11/64" clearance between upper edge of choke valve and inner wall of air horn (gauge T109 166) Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

SECONDARY THROTTLE LEVER ADJUSTMENT The stop lug on both primary and secondary throttle levers should contact boss on flange at the same time To adjust bend secondary throttle operating rod at angle (use bending tool T109-213)

AUXILIARY THROTTLE LOCK-OUT ADJUSTMENT This ad justment should be made after completing fast idle adjustment 1 With choke valve closed edge of hook on lockout arm should contact auxiliary throttle lever making maximum contact of locking step on lever 2 Open choke valve Auxiliary throttle valve should become unlocked a few degrees before the choke reaches wide open position Adjust by bending lock out arm

CHOKE ADJUSTMENT (CROSS OVER TYPE) See Form 3657 1 Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page Hold in this position with screw driver and tighten lock nut **NOTE**· Screw driver may be held in vise so that one hand may be used to support housing while tightening nut 2 After adjustment is completed and coil hous ing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without affecting calibration

MODEL "P-28"

With Throttle Restrictors

BBS Down-Draft Climatic® Control **Carbureter No. 2403S**

CARBURETER SPECIFICATIONS

For Plymouth Six Cylinder Engine: 3.25 Inch Bore, 4.63 Inch Stroke

Dimensions: Flange size 1½ inch S A E Throttle bore 1-11/16 inch Main venturi, 1 11/32 inch I D

Float Setting: See adjustments

Vents: Outside, none Inside, balance vent tube

Gasoline Intake: Size No 44 (.086 inch) drill in needle seat

Idle Tube: Jet size 028 inch diameter Idle passage air bleed in body size 061 inch diameter Restriction in body size 057 inch diameter

Idle Port: Upper, slot type, length 195 inch width 030 inch

Idle Port Opening: Top of port located 140 to 144 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 053 to 057 inch diameter

Set Idle Adjustment Screw: ½ to 1¾ turns open For richer mixture turn screw out Idle engine between 450 500 r p m gear shift lever in neutral

Main Metering Jet: Calibrated to flow 382 cc per minute (Do not gauge for size, if in doubt replace with new part)

Main Vent Tube: Side holes 6—.0354 inch diameter Bleed in top of tube .0236 inch diameter

Step-Up Rod: (Vacuum operated) size 021 inch

Accelerating Pump: Pump intake passage, ball check seat, size 110 to 120 inch diameter Pump discharge passage, ball check seat, 110 to 120 inch diameter in body Pump (discharge) jet, size 0276 inch drill Bleed hole in pump plunger plate size 020 inch diameter

Pump Adjustment: See adjustments

Choke: Carter Climatic® Control set on index Choke heat suction hole, in body, size No 38 (.1015 inch) drill NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermostatic coil and housing assembly

Vacuum Spark Port: Slot (round end) type Size .030 by 110 inch Top of port .044 to .050 inch above top edge of valve with valve tightly closed

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle making sure the float pin is at the bottom of its guide slots The distance from the top surface of the body casting to the top of each float should be 9/32 inch (gauge T109-239) If one float is lower than the other equalize by bending the float arm If both floats require the same correction adjust by bending lip on float arm The floats must not rub anywhere against the inner walls of the bowl If necessary bend float arms slightly to provide clearance on all sides of floats

PUMP ADJUSTMENT Back out throttle adjusting screw and open choke valve so that throttle valve seats in bore of carbureter Install throttle connector rod in center hole of throttle lever The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 54/64 inch Adjust by bending throttle connector rod at lower angle (use Tool T109-213)

FAST IDLE ADJUSTMENT Remove thermostatic coil housing assembly gasket and baffle plate With throttle adjusting screw backed out crack throttle valve and hold choke valve in fully closed position Then close throttle This will allow fast idle cam to revolve to fast idle position There should now be 016 020 inch clearance (use gauge T109 44) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle (use Tool T109 213)

UNLOADER ADJUSTMENT This adjustment must be made after the fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing There should now be 9/64 inch clearance (use gauge T109-34) between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever (use tool T109 214) When fast idle and unloader adjustments have been made assemble baffle plate coil housing gasket and themrostatic coil housing assembly on air horn Set Climatic® Control as specified making sure that hook on coil has picked up coil shaft lever

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3656

Float Level ¼" (Gauge T109 282) between top of each float and top surface of body casting To adjust bend lip on float arm

Pump 1 1/32" from the top of the bowl cover to the top of the plunger shaft Install throttle connector rod in center hole (medium stroke) of throttle lever and inner hole of pump arm To adjust bend throttle connector rod

Fast Idle Cam Clearance With choke valve closed and lip on inner choke shaft lever contacting lug on outer lever there should be 020" (Gauge T109 29) between lip of fast idle cam and boss on casting To adjust bend lip on inner choke shaft lever Optional adjustment (late production) align index mark with adjusting screw

Fast Idle Throttle Valve Clearance 015" (Gauge T109 44) between lower edge of valve and bore with adjusting screw on high step of cam

Fast Idle on Car 1350 to 1400 R P M

Unloader 3/16" (Gauge T109 28) between top edge of choke valve and inner wall of air horn with throttle valves wide open To adjust bend unloader arm on throttle lever

Dash Pot (Slow Closing Throttle) Close throttle valves and bottom plunger shaft with 1/16" gauge between shaft and operating lever To adjust loosen lock nut and turn dash pot unit in or out

Overdrive Kickdown Switch With throttle valves wide open there should be 1/64" to 3/64" between kickdown lever and switch stem guide To adjust loosen lock nuts and adjust switch

Choke Adjustment (Cross Over Type) See Form 3657. 1 Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed under carbureter specifications Hold in this position with screw driver and tighten lock nut

Note Screw driver may be held in vise so that one hand may be used to support housing while tightening nut

2 After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without effecting calibration

BBD Dual Down-Draft Climatic® Control **Carbureters Nos. 2422S-2423S-2424S**

CARBURETER SPECIFICATIONS

For Plymouth 8 Cylinder Engine· 3.63 Inch Bore, 3.256 Inch Stroke

Dimensions: Flange size 1¼ inch dual 4 bolt type
Throttle bore, 1-7/16 inch I D
Primary venturi, ⅜ inch I D
Main venturi, 1-3/16 inch I D

Vent: Inside, balance vent tube to bowl, in air horn above choke valve

Gasoline Intake: Size No 38 (.1015 inch) drill hole in needle seat

Idle Tube: Jet size No 65 (.035 inch) drill
Idle bleed (in venturi cluster screw), size 059 inch diameter
Idle restriction (in venturi cluster screw), size 0472 inch diameter

Idle Port: Upper, slot type length, 189 inch; width, .030 inch

Idle Port Opening: 148 to 152 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 053 to 057 inch diameter

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture, turn screw out With gear shift lever in neutral position idle engine between 450 and 500 RPM

Main Nozzle Nozzle is installed permanently DO NOT REMOVE.

Main Vent Tube: Side holes 8—size 0354 inch diameter Main vent in top of tube, size 0256 inch diameter

Step-Up Rod: (Vacuum Operated) 018 inch diameter

Metering Jet· Calibrated to flow 316 to 324 cc per minute (Do not gauge for size, if in doubt replace with new part)

Accelerating Pump: Pump discharge jets (2—In venturi cluster) size 0275 inch diameter
Intake ball check seat size 130 to 140 inch diameter
Discharge ball check seat size 110 to 120 inch diameter

Choke: Carter Climatic® Control set at index Butterfly type, offset valve Choke heat suction hole in body, size No 38 (.1015 inch) drill

NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermostatic coil and housing assembly

Vacuum Spark Port: Horizontal, round end type, 030 by 110 inch Top of port to be 035 to 045 inch above upper edge of valve with valve closed tight

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open·	Float Setting	Idle Adjustment Screw Setting
.035"	.017"	4° B. T. C. At Vibration Damper	7/32 Inch (Use Gauge T109-239)	½ to 1½ Turns Open Idle engine at 450 to 500 R.P.M. In Neutral

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER
TRADE MARK REG U. S PAT OFF.
MARCA REGISTRADA

PRINTED IN U S A

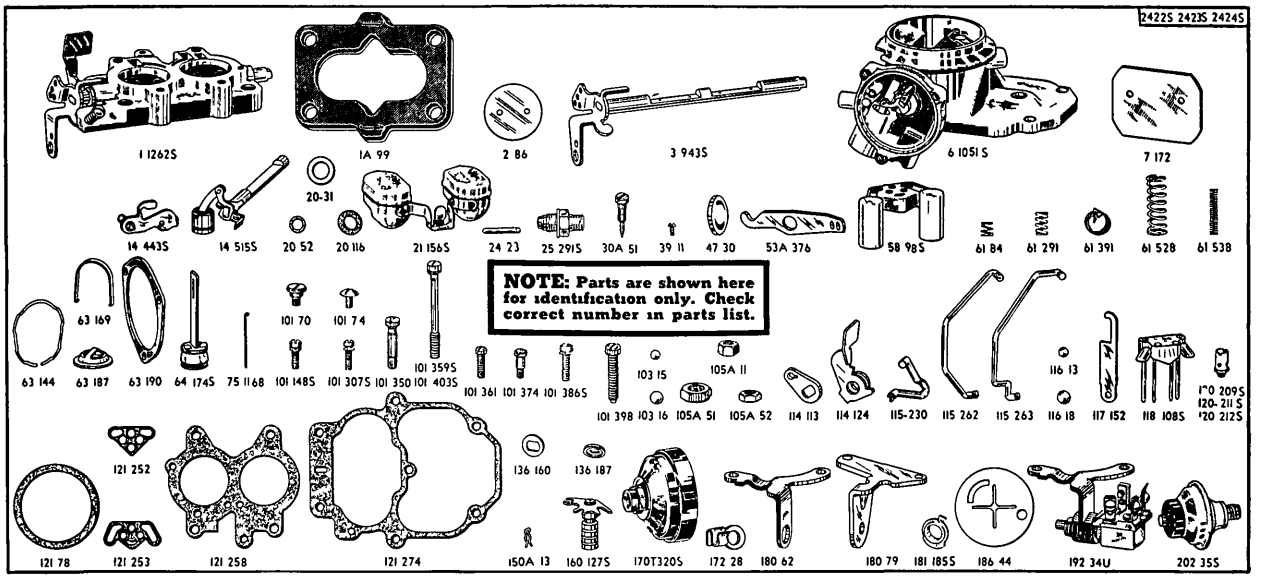
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance from the top surface of the body casting to the top of each float should be 1/4 inch (gauge T109-282). If one float is lower than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.

PUMP ADJUSTMENT: Back out throttle adjustment screw and open choke valve so that throttle valves seat in bores of carbureter. Install throttle connector rod in outer hole (medium stroke) of throttle lever and inner hole of pump arm. The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 1 inch. Adjust by bending pump connector rod (2422S-2423S) at lower angle; (2424S) at upper angle (use tool T109-213).

FAST IDLE ADJUSTMENT: Remove thermostatic coil housing, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position. There should now be .015"-.019" clearance (use gauge T109-44) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle (use tool T109-213).

CAUTION: Be sure cam trip lever is all the way in piston housing with lug contacting cam.



UNLOADER ADJUSTMENT: This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 1/4 inch clearance (use gauge T109-31) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on choke trip lever (use tool T109-214). When fast idle and unloader adjustments have been made, assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn. Set Climatic® Control at index, making sure that hook on coil has picked up coil shaft lever.

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT: The purpose of this unit is to prevent the car from stalling when the throttle is released rapidly. Maximum action is obtained by loosening lock nut and adjusting the dash pot unit so that the plunger shaft can be bottomed with a 1/16 inch gauge placed between shaft and operating lever with throttle valve tightly closed. Then tighten lock nut.

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT: With throttle valves in wide open position adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance between kickdown lever and switch stem guide.

NOTE: If necessary bend kickdown lever to contact switch stem.

CARBURETER ADJUSTMENTS

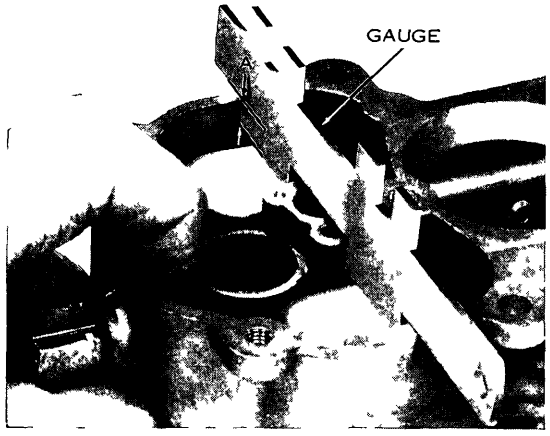

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1)

This adjustment must be made with the bowl cover gasket and float pin retainer removed Hold the lip on float arm against the seated intake needle making sure the float pin is at the bottom of its guide slots The distance (A) from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109 239) If one float is lower than the other equalize by bending the float arm If both floats require the same correction adjust by bend ing lip on float arm The floats must rot rub anywhere against the inner walls of the bowl If necessary bend float arms slightly to provide clearance on all sides of floats

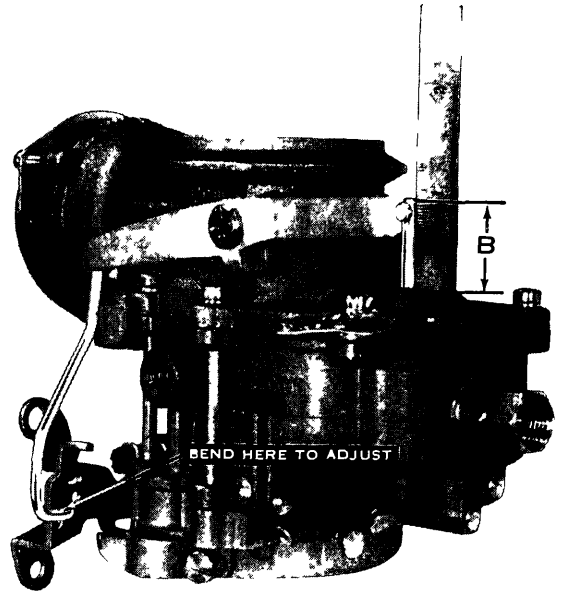

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig 2)

Back out throttle adjust ng screw and open choke valve so that throttle valve seats in bore of carbureter Install throttle connector rod in center hole of throttle lever The distance (B) trom the top of the bowl cover to the top of plunger shaft (not pump arm) should be 54/64 inch Adjust by bending throttle connector rod at lower angle (use Tool T109 213)

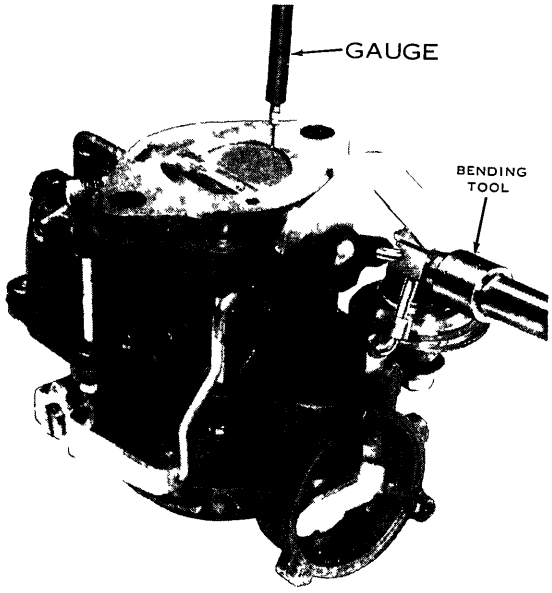

Figure 3
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig 3)

Remove thermostatic coil housing assembly gasket and baffle plate With throttle adjusting screw backed out crack throttle valve and hold choke valve in fully closed position Then close throttle This will allow fast idle cam to revolve to fast idle position There should now be 016 020 incn clearance (use gauge T109 44) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle (use Tool T109 213)

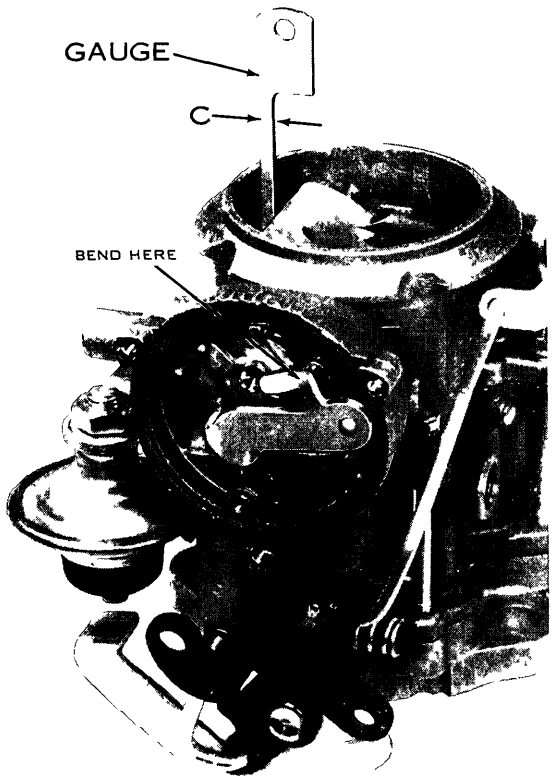

Figure 4
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 4):
This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 9/64 inch clearance (C) (use gauge T109-34) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on choke trip lever (use tool T109-214). When fast idle and unloader adjustments have been made, assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn. Set Climatic® Control as specified making sure that hook on coil has picked up coil shaft lever

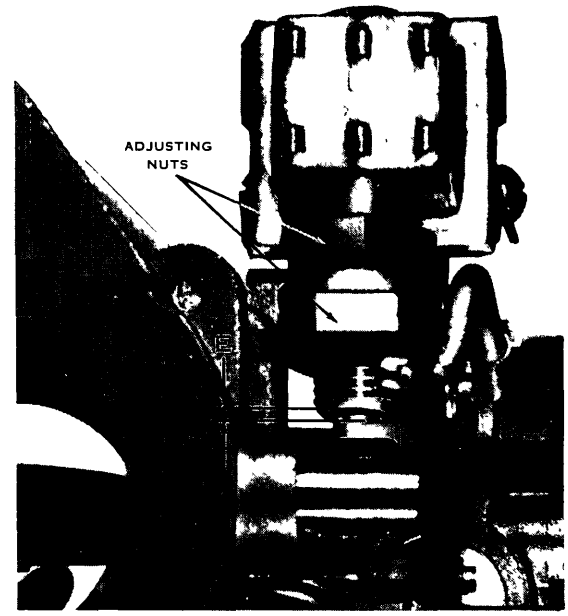

Figure 5
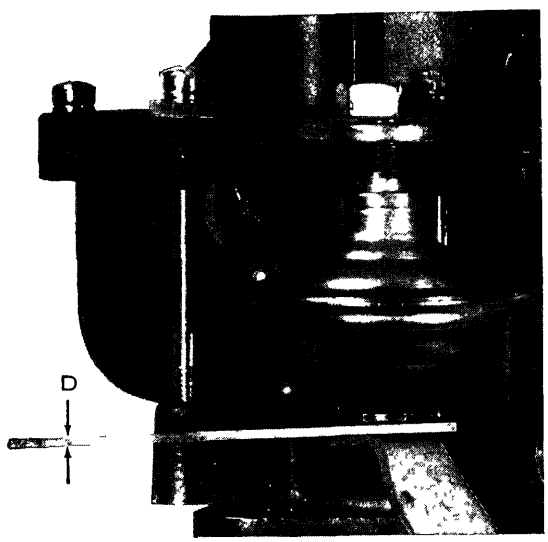
Overdrive Kickdown Switch Adjustment

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT (Fig. 5):
With throttle valve in wide open position adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance (E) between kickdown lever and switch stem guide.



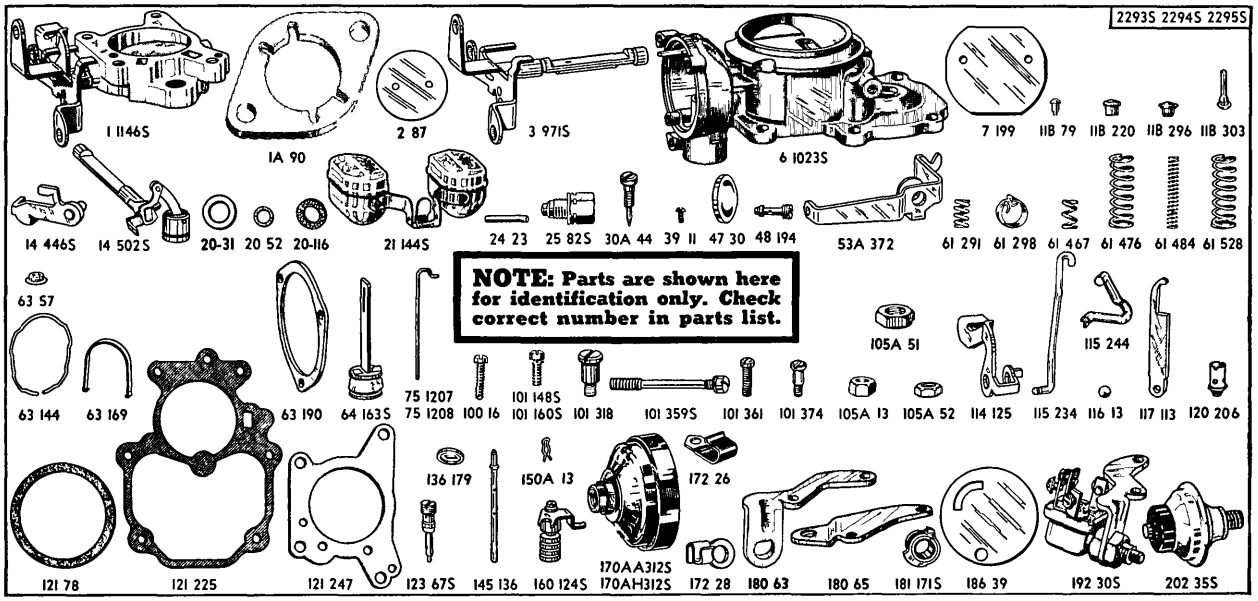


Figure 6
Dashpot Adjustment

DASHPOT (SLOW CLOSING THROTTLE) ADJUSTMENT (Fig. 6):

The purpose of the dashpot is to prevent the car from stalling when the throttle is released rapidly. Maximum dashpot action is obtained by loosening lock nut and adjusting the dashpot unit so that the dashpot plunger shaft can be moved inward approximately 3/32 inch (D) with the throttle valve tightly closed. Then tighten lock nut.

Plymouth—1956—Carbureters Nos. 2293S-2294S-2295S-2380S

WHEN SERVICING, USE GASKET ASSORTMENT No 252 REPAIR PACKAGE No 1817

BBD Dual Down-Draft Climatic® Control **Carbureters Nos. 2299S-2300S-2301S**

CARBURETER SPECIFICATIONS

For Plymouth 8 Cylinder Engine: 3.75 Inch Bore, 3.13 Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type. Throttle bore, 1-7/16 inch I D Primary venturi, ⅜ inch I. D. Main venturi, 1-3/16 inch I D.
Float Level: See adjustments
Vent: Inside, balance vent tube to bowl, in air horn above choke valve
Gasoline Intake: Size No. 38 (.1015 inch) drill hole in needle seat
Idle Tube: Jet, size No 65 (035 inch) drill Idle bleed (in venturi cluster screw) size (2299S-2300S) 0629 inch, (2301S) 0669 inch diameter Idle restriction (in venturi cluster screw), size 0472 inch diameter.
Idle Port: Upper, slot type, length, 189 inch; width, 030 inch
Idle Port Opening: 144 to .148 inch above upper edge of valve with valve tightly closed
Lower Port (For Idle Adjustment Screw): Size 053 to 057 inch diameter
Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out With gear shift lever in neutral position idle engine between 450 and 500 RPM
Main Nozzle: Nozzle is installed permanently DO NOT REMOVE
Main Vent Tube: Side holes 8—size 0354 inch diameter Main vent in top of tube, size .0256 inch diameter
Step-Up Rod: (Vacuum operated) (2299S-2300S) .018 inch (2301S) 020 inch diameter.
Metering Jet: Calibrated to flow 316 to 324 cc per minute. (Do not gauge for size if in doubt, replace with new part)
Accelerating Pump: Pump discharge jets (2—in venturi cluster), size 0275 inch diameter Intake ball check seat, size .130 to 140 inch diameter Discharge ball check seat, size .110 to 120 inch diameter.
Pump Adjustment: See adjustments
Choke: Carter Climatic® Control Cross Over Choke Type, set at index Butterfly type, offset valve Choke heat suction hole, in air horn, size No 44 (086 inch) drill
Vacuum Spark Port: Horizontal, round end type, 030 by 110 inch Top of port to be 035 to 045 inch above upper edge of valve with valve closed tight

Motor Tune-Up—Be Accurate!

CAUTION: **Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.**

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3656

Float Level: ¼" (Gauge T109 282) between top of each float and top surface of body casting To adjust bend lip on float arm

Pump: 1-1/32" from the top of the bowl cover to the top of the plunger shaft Install throttle connector rod in center hole (medium stroke) of throttle lever and inner hole of pump arm To adjust bend throttle connector rod

Fast Idle Cam Clearance: With choke valve closed and lip on inner choke shaft lever contacting lug on outer lever there should be 020" (Gauge T109-29) between lip of fast idle cam and boss on casting Optional adjustment (late production) align index mark with adjusting screw To adjust bend lip on inner choke shaft lever
Fast Idle Throttle Valve Clearance: 015" (Gauge T109-44) between lower edge of valve and bore with adjusting screw on high step of cam.
Fast Idle on Car: 1350 to 1400 R P.M.
Unloader: 3/16" (Gauge T109-28) between top edge of choke valve and inner wall of air horn with throttle valves wide open To adjust bend unloader arm on throttle lever
Dash Pot (Slow Closing Throttle): Close throttle valves and bottom plunger shaft with 1/16" gauge between shaft and operating lever To adjust loosen lock nut and turn dash pot unit in or out
Overdrive Kickdown Switch: With throttle valves wide open there should be 1/64" to 3/64" between kickdown lever and switch stem guide To adjust loosen lock nuts and adjust switch.

Choke Adjustment (Cross Over Type) See Form 3657 1 Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed under carbureter specifications Hold in this position with screw driver and tighten lock nut

Note Screw driver may be held in vise so that one hand may be used to support housing while tightening nut

2 After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without effecting calibration

CARTER MODEL BBD CARBURETER FOR PLYMOUTH
(SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor Corporation, Catalog Department, St. Louis (7), Missouri. Specify the carburetor number found on the brass identification tag, when requesting specification pages.

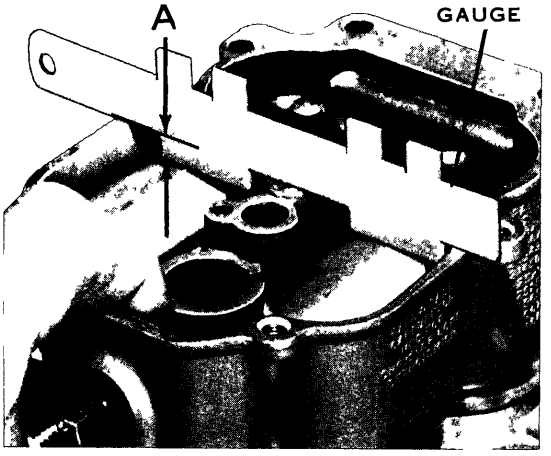

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance (A) from the top surface of the body casting to the top of each float should be as listed on carbureter specification page. If one float is lower than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.

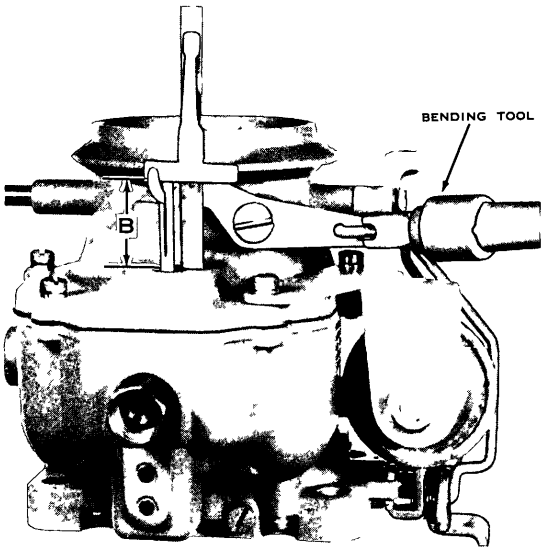

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig. 2):

1. Back out throttle adjustment screw and open choke valve so that throttle valves seat in bores of carbureter.
2. Install throttle connector rod in the holes in the throttle lever and pump arm specified on carbureter specification page.
3. The distance from the top of the bowl cover to the top of the plunger shaft should be as specified on carbureter specification page.
4. Adjust by bending pump connector rod. (Use bending tool T109-213.)

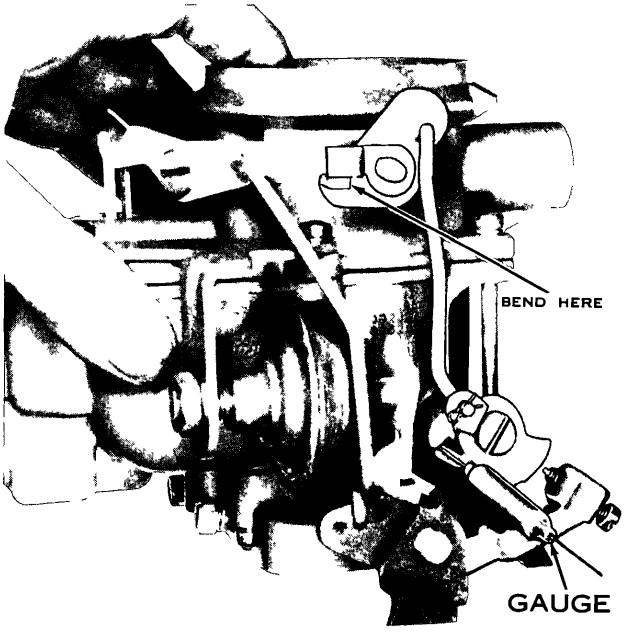

Figure 3
Fast Idle Adjustment

FAST IDLE CAM CLEARANCE ADJUSTMENT (Fig. 3):

1. Hold choke valve tightly closed.
2. With lip on inner choke shaft lever contacting lug on outer lever, there should be the clearance listed on carbureter specification page between lip of fast idle cam and boss on casting.
3. Adjust by bending lip on inner choke shaft lever. (Use bending tool T109-22.)

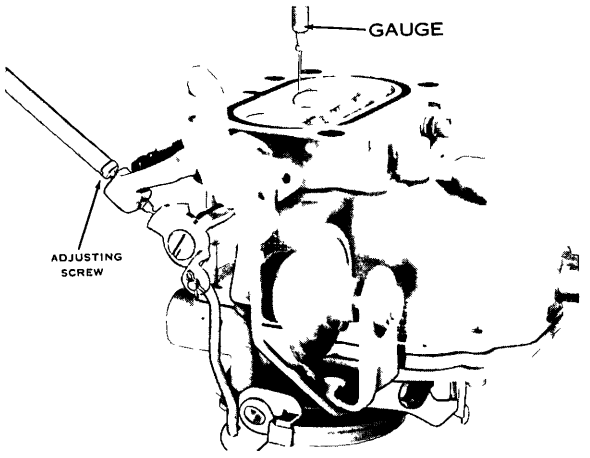

Figure 4
Fast Idle Adjustment

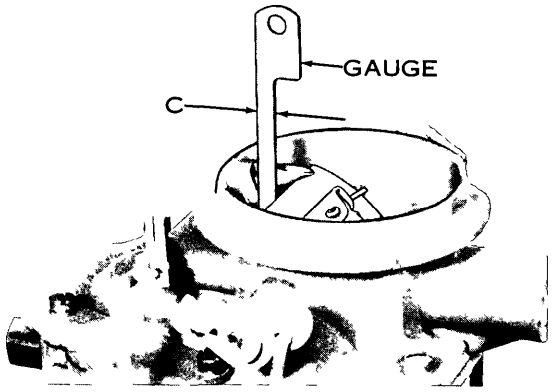

Figure 5
Unloader Adjustment

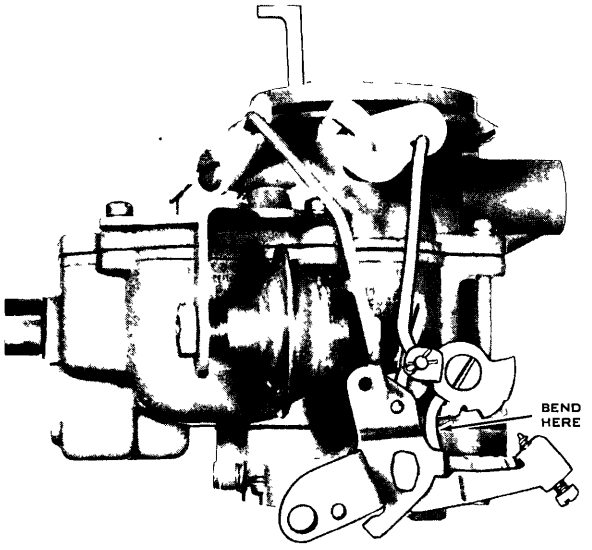

Figure 5A
Unloader Adjustment

UNLOADER ADJUSTMENT (Figs. 5 & 5A):

1. Hold throttle valves wide open.
2. Close choke valve as far as possible without forcing.
3. Clearance between top edge of choke valve and inner wall of air horn should be as listed on carbureter specification page.
4. Adjust by bending choke unloader arm on throttle lever. (Use bending tool T109-213.)

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 4):

1. Be sure choke valve is closed.
2. Adjust fast idle adjusting screw against high step of cam until th cl arance between throttle valve (side opposite port) and bore is as listed on carbureter specification page.

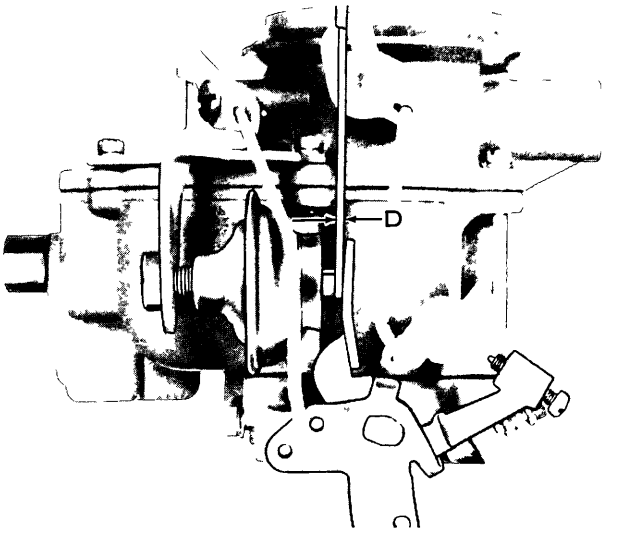

Figure 6
Dash Pot Adjustment

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT (Fig. 6):

The purpose of this unit is to prevent the car from stalling when the throttle is released rapidly. Maximum action is obtained by loosening lock nut and adjusting the dash pot unit so that the plunger shaft can be bottomed with a 1/16 inch gauge placed between shaft and operating lever (D) with throttle valves tightly closed.

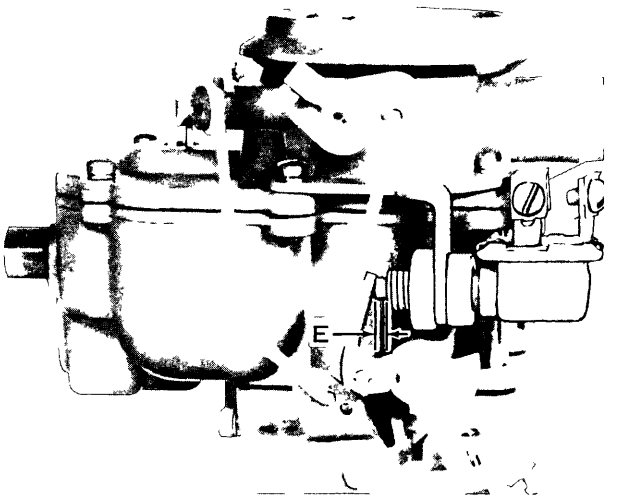

Figure 7
Overdrive Kickdown Switch Adjustment

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT (Fig. 7):

With throttle valves in wide open position, adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearanc (E) betwe n kickdown lever and switch stem guide.

CARTER CLIMATIC® CONTROL CROSS OVER CHOKE TYPE
(SERVICE INFORMATION AND ADJUSTMENT PROCEDURE)

NOTE: Coil housing and rod assembly may be cleaned in carbureter parts cleaner without disassembling. After cleaning rinse in solvent and blow out inside of housing with compressed air. After rinsing make sure housing revolves freely on mounting post. If disassembly is necessary for thorough cleaning, follow steps under "reassembly" to be sure coil is installed properly.

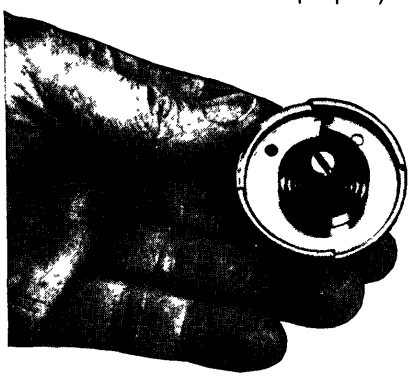

Figure A

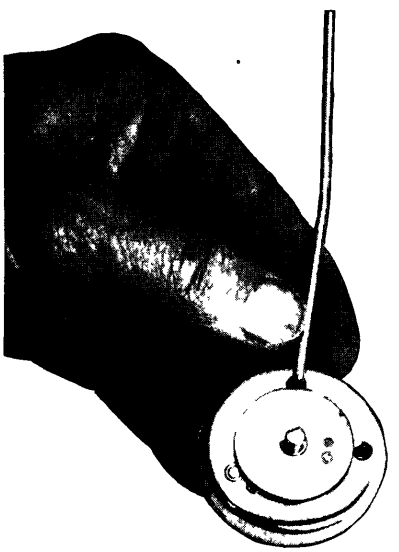

Figure B

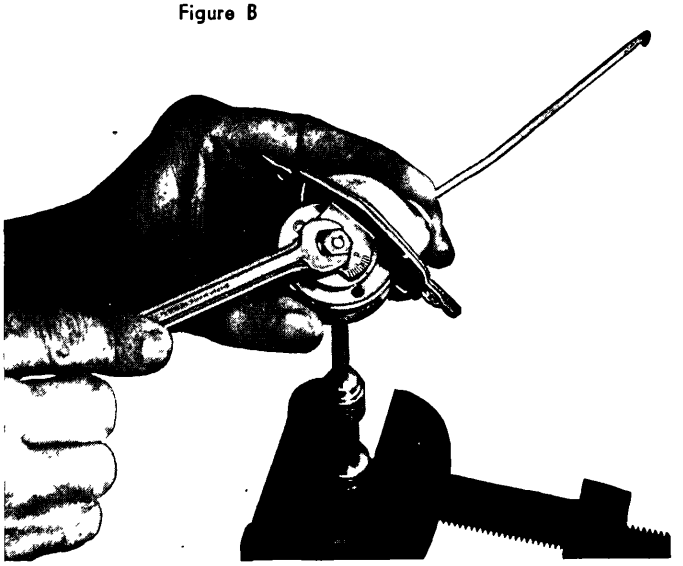

Figure C

TWO PIECE CLOSED HOUSING

REASSEMBLY:

1. Place coil mounting post in either half of coil housing.
2. Insert thermostatic coil on mounting post with hook facing clockwise. (See Fig. A.)
3. Assemble second half of housing and secure on mounting post with washer and hair pin. Be sure holes in both housings are in alignment.
4. Install connector rod with hair pin end extending through either hole toward split end of mounting post. Secure with washer and hair pin. (Eye of hair pin extending outward.)
5. Place index disk on mounting post with flat on disk aligning with flat on post and turn disk and post counter-clockwise until hook on coil engages connector rod. Index mark on disk should be just to the right (approximately 2 o'clock position) of connector rod when holding housing with rod pointing to 12 o'clock position. (See Fig. B.) If incorrectly installed turn index disk over.
6. Assemble housing cover to mounting post and install lock washer and nut.
7. Install cover disk on connector rod.

ADJUSTMENT:

1. Loosen mounting post lock nut and turn mounting post with screw driver until index mark on disk is positioned as listed on carbureter specification page. Hold in this position with screw driver and tighten lock nut. (See Fig. C.)

   NOTE: Screw driver may be held in vise so that one hand may be used to support housing while tightening nut.
2. After adjustment is completed and coil housing and rod assembly and carbureter is installed on engine lift cover disk and open and close choke valve manually to see if connector rod clears sides of hole in housing cover. If rod does not clear hole in housing cover without binding replace with a new unit since connector rod cannot be bent without effecting calibration.

ONE PIECE OPEN HOUSING

REASSEMBLY:

1. Place housing with circular edge downward and center web at 3 o'clock position. (See Fig. D.)
2. Insert thermostatic coil into housing with hook on coil in 4 o'clock position and pointing toward web of housing.
3. Insert mounting post through housing and coil with index mark toward hook on coil. (See Fig. E.)
4. Secure mounting post to housing with washer and pin spring.
5. Install cover disk on connector rod.
6. Install connector rod through housing cover into housing toward split end of mounting post. Secure with washer and pin spring. (Eye of pin spring extending outward.)
7. Assemble housing cover to mounting post with lock washer and nut. Rotate mounting post counterclockwise until hook on coil picks up connector rod and tighten nut.
8. Check positive spring action by pushing connector rod downward through housing cover.

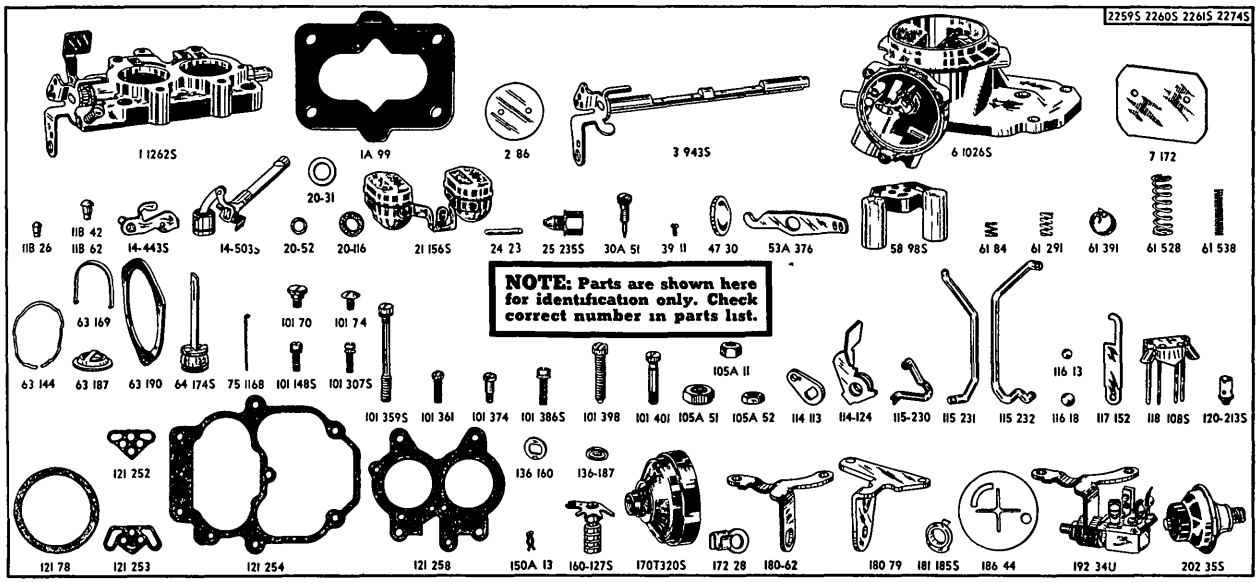
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance from the top surface of the body casting to the top of each float should be 1/4 inch (gauge T109-282). If one float is lower than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If neccessary, bend float arms slightly to provide clearance on all sides of floats.

PUMP ADJUSTMENT: Back out throttle adjustment screw and open choke valve so that throttle valves seat in bores of carbureter. Install throttle connector rod in outer hole (medium stroke) of throttle lever and inner hole of pump arm. The distance from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 1 inch. Adjust by bending pump connector rod (2259S-SA-SB-2260S-SA-SB) at lower angle; (2261S-SA-SB-2274S-SA) at upper angle (use tool T109-213).

FAST IDLE ADJUSTMENT: Remove thermostatic coil housing, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position. There should now be .015"-.019" clearance (use gauge T109-44) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle (use tool T109-213).



UNLOADER ADJUSTMENT: This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 1/4 inch clearance (use gauge T109-31) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on choke trip lever (use tool T109-214). When fast idle and unloader adjustments have been made, assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn. Set Climatic® Control at index, making sure that hook on coil has picked up coil shaft lever.

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT: The purpose of this unit is to prevent the car from stalling when the throttle is released rapidly. Maximum action is obtained by loosening lock nut and adjusting the dash pot unit so that the plunger shaft can be bottomed with a 1/16 inch gauge placed between shaft and operating lever with throttle valves tightly closed. Then tighten lock nut.

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT: With throttle valves in wide open position adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance between kickdown lever and switch stem guide.

NOTE: If necessary bend kickdown lever to contact switch stem.

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2253S**

CARBURETER SPECIFICATIONS

For Plymouth 8 Cylinder Engine: 3.563 Inch Bore, 3.25 Inch Stroke

Dimensions: Flange size, 1 1/8 inch Four Bore—4 bolt type. Primary venturi size, 11/32 inch I. D. Main venturi size, 1-1/16 inch I. D.

Float Level: See adjustments.

Vents: Combination inside and outside (6).

Gasoline Intake: Size No. 42 (.0935 inch) drill; in needle seat.

Low Speed Jet Tube: Jet, primary and secondary, size (.0293 inch) diameter. By-pass, in body, size primary No. 52 (.0635 inch) drill, secondary (.057 inch) diameter. Economizer, in body, size (.0453 inch) diameter. Idle bleed, in body, size primary (.059 inch) diameter, secondary No. 44 (.086) drill.

Idle Port: Upper, slot type, primary, length .175 inch; width .030 inch. Secondary, length .103 inch; width .030 inch.

Idle Port Opening: Primary .116 to .122 inch, secondary .059 to .065 inch above top edge of valve with valve tightly closed.

Lower Port: Primary (for idle adjustment screw), size No. 55 (.052 inch) drill.

Secondary (no idle adjustment screw), size No. 57 (.043 inch) drill.

Set Idle Adjustment Screw: 1/2 to 1 1/2 turns open. For richer mixture turn screw out. Do not idle engine below 450 R.P.M. in neutral.

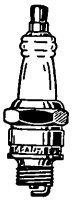
Main Nozzle: Installed permanently. DO NOT REMOVE. Anti percolating jet (4) size No. 70 (.028 inch) drill.

Metering Rod: Primary: Economy step .076 inch diameter. Middle step tapers to .066 inch diameter. Power step .048 inch diameter. Secondary: none.

Metering Rod Jet: Primary: Size .0935 inch diameter. Secondary: Size .057 inch diameter.

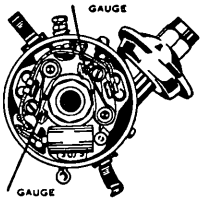
Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 74 (.0225 inch) drill. Intake ball check seat, size .115 to .120 inch diameter. Discharge needle seat, size No. 50 (.070 inch) drill. Relief passage (vent) to fuel chamber, size No. 42 (.0935 inch) drill. Discharge relief plug, size No. 74 (.022 inch) drill.



Pump Adjustment: See adjustments.

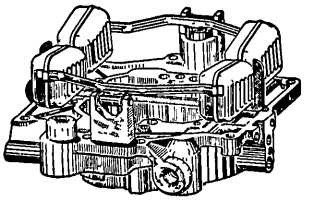
Choke: Carter Climatic® Control, set on index. Butterfly type offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 42 (.0935 inch) drill.



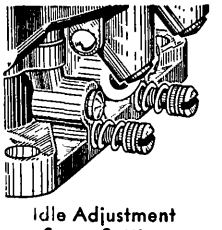
Vacuum Spark Port: Horizontal slot (round end) .045 x .110 inch. Top of port .035 to .045 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .017"

Ignition Timing Breaker Points to Open: 4° B. T. D. C.

Float Setting See Adjustments

Idle Adjustment Screw Setting 1/2 to 1 1/2 Turns Open

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT (Fig. 1):

Two separate float adjustments must be made—lateral and vertical

LATERAL ADJUSTMENT With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge (A) Adjustment should be made by bending arms of floats

VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance (B) between top of float and machined surface of casting must be 1/8" (gauge T109 232) for primary floats; and 3/16" (gauge T109-222) for secondary floats Adjust by bending float arms.

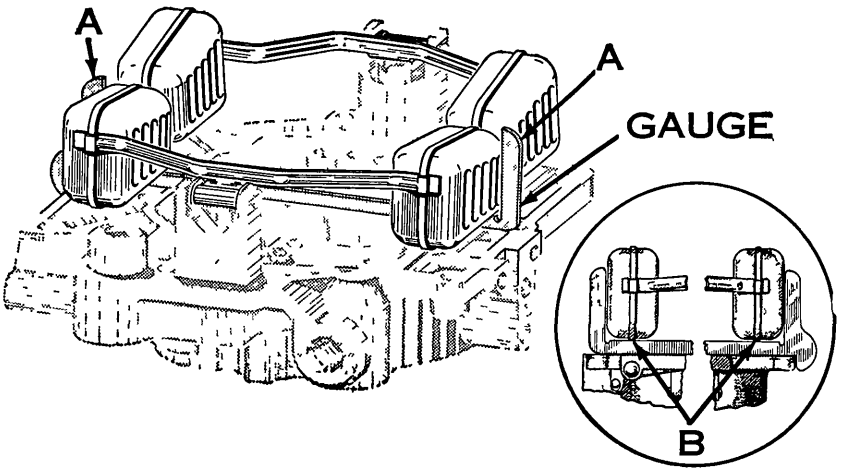

Figure 1
Float Adjustment

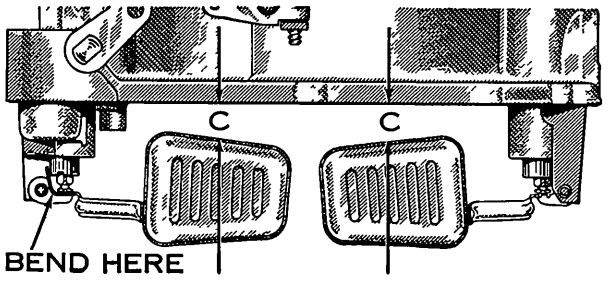

Figure 2
Float Drop Adjustment

FLOAT DROP ADJUSTMENT (Fig. 2):

With bowl cover held in upright position and measuring from center of floats the distance (C) between top of floats and bowl cover should be 5/8" for primary floats and 11/16" for secondary floats Adjust by bending stop tabs on float bracket.

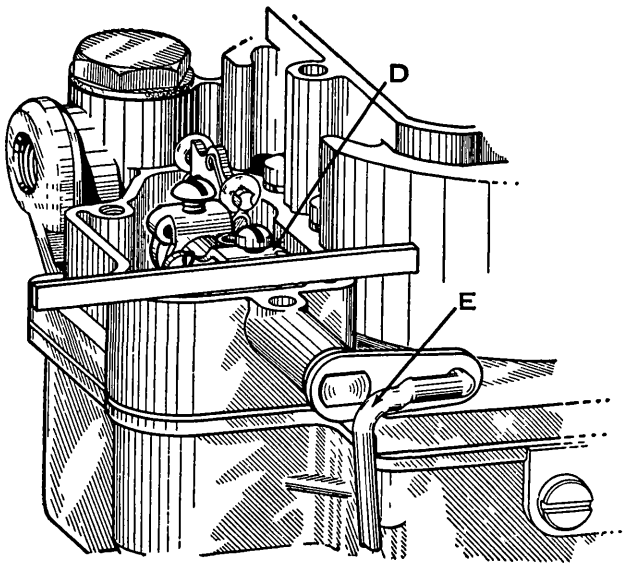

Figure 3
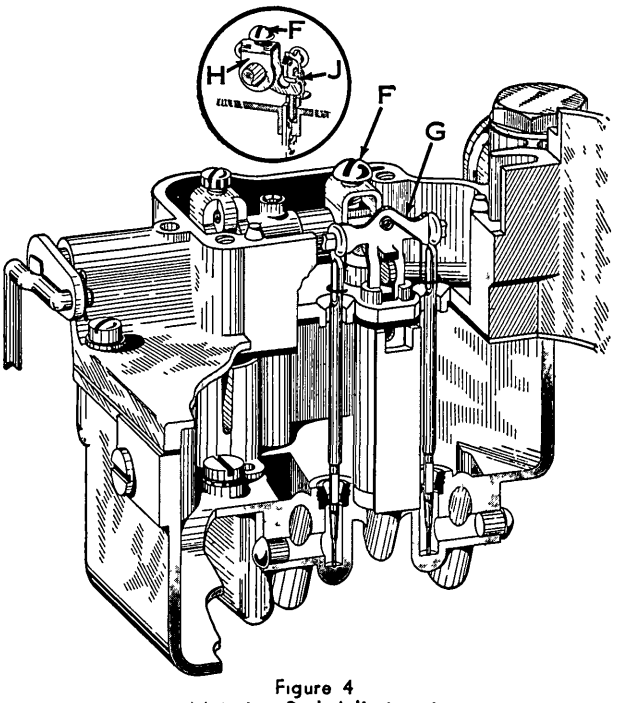
Pump Adjustment

PUMP ADJUSTMENT (Fig. 3):

Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm (D) should be parallel to straight edge Adjust by bending throttle connector rod at upper angle (E) (Use tool T109 213.)



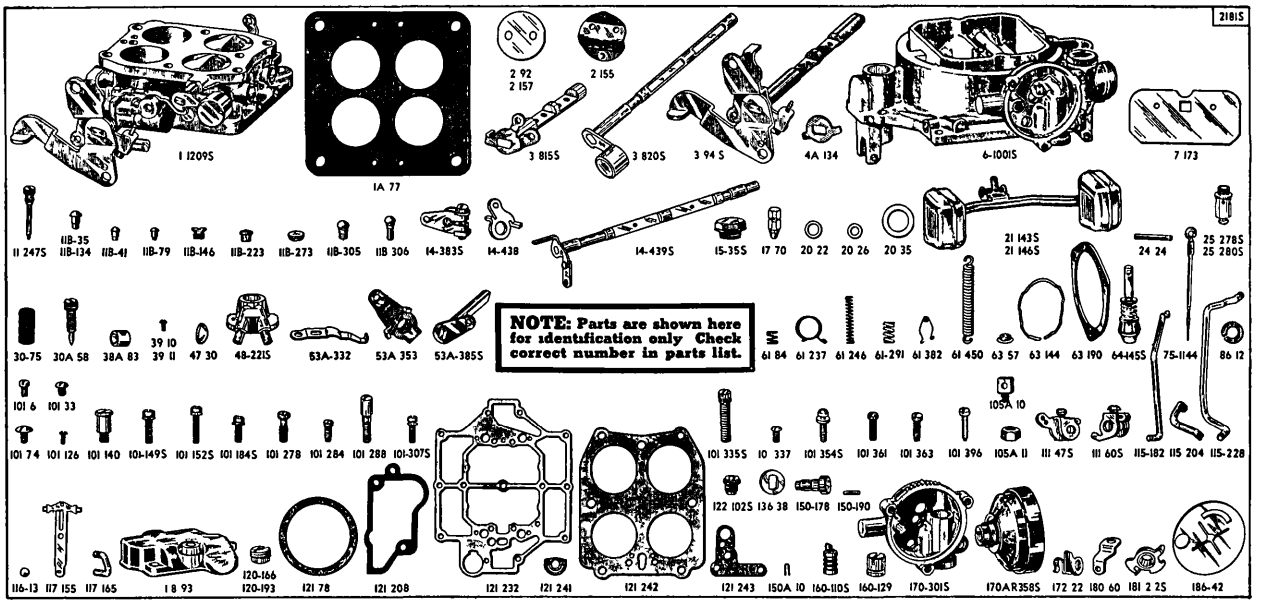


Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (F) 2 With metering rods in place press down on vacumeter link (G) until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated, revolve metering rod arm (H) until finger on arm contacts lip of vacumeter link (J). Hold in place and carefully tighten clamp screw (F).

Nos. 2141S-2154S-2155S-2262S

CARBURETER SPECIFICATIONS

For Plymouth 8 Cylinder Engine 3.44 Inch Bore, 3.25 Inch Stroke

Dimensions Flange size 1¼ inch dual 4 bolt type
Throttle bore 1 5/16 inch I D
Primary venturi ⅜ inch I D
Main venturi 1 1/16 inch I D

Float Level See adjustments

Vent Inside balance vent tube to bowl in air horn above choke valve

Gasoline Intake Size No 38 (1015 inch) drill hole in needle seat

Idle Tube Jet size No 65 (035 nch1 dr II
Idle bleed (in venturi cluster screw) size 063 inch drill
Idle restriction (in venturi cluster screw) size 0472 inch drill

Idle Port Upper slot type length 192 inch width 030 inch

Idle Port Opening 133 to 137 inch above upper edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw) Size 053 to 057 inch diameter

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out With gear shift lever in neutral position idle engine between 450 and 500 RPM

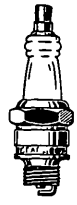
Main Nozzle Nozzle s installed permanently DO NOT REMOVE

Main Vent Tube Side holes 8—0354 inch diameter Bleed in top of tube size 0256 inch drill

Step Up Rod (Vacuum operated) 022 inch diameter

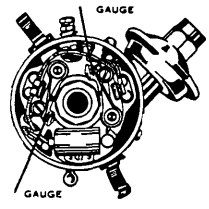
Metering Jet Calibrated to flow 287 to 293 cc per minute (Do not gauge for size if in doubt replace with new part)

Accelerating Pump Pump discharge jet (2—In venturi cluster) size 0275 inch drill
Intake ball check seat size 135 to 140 inch diameter
Discharge ball check seat size 115 to 120 inch diameter



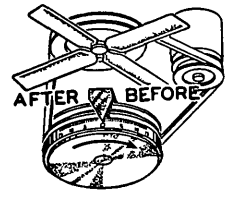
Pump Adjustment See adjustments

Choke Carter Climatic® Control set at index Butterfly type offset valve Choke heat suction hole in body size No 38 (1015 inch) drill NOTE Thermostatic coil should not be removed from delayer mounting post If defective replace with complete thermostatic coil and housing assembly



Vacuum Spark Port Horizontal round end type 030 by 110 inch Top of port to be 030 to 040 inch above upper edge of valve with valve closed tight

Motor Tune-Up—Be Accurate!



CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

CARBURETER ADJUSTMENTS

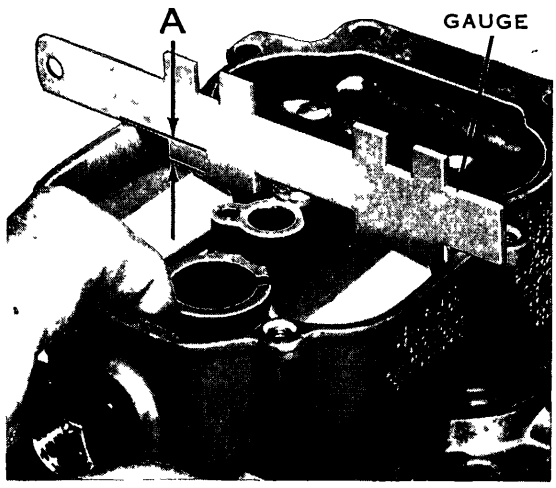

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom ot its guide slots. The distance (A) from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109-239). If one float is lower than the other, equalize by bending the float arm If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.

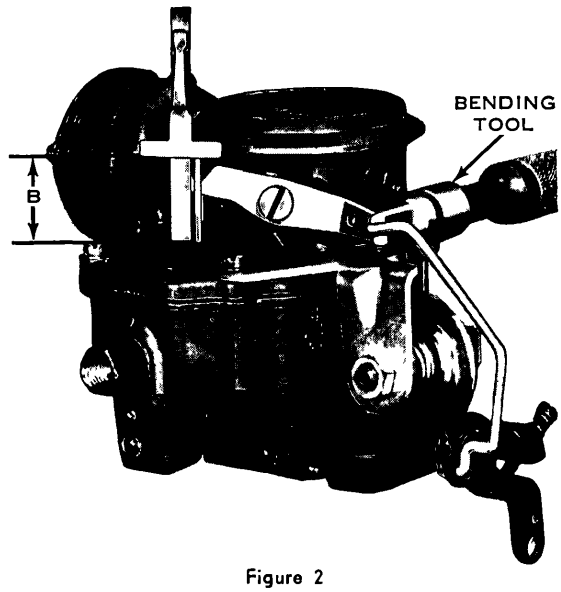

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig. 2):

Back out throttle adjustment screw and open choke valve so that throttle valves seat in bores of carbureter. Install throttle connector rod in outer hole (medium stroke) of throttle lever and outer hole of pump arm. The distance (B) from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 58/64 inch. Adjust by bending throttle connector rod (2155S-2262S) at upper angle, (2141S-2154S) at lower angle (use tool T109-213).

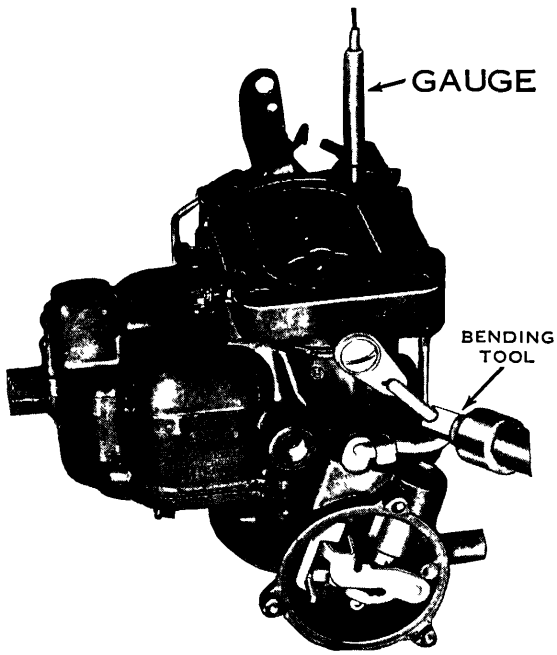

Figure 3
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 3):

Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position. There should now be .009"-.013" clearance (use gauge T109-200) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle (use tool T109-213).

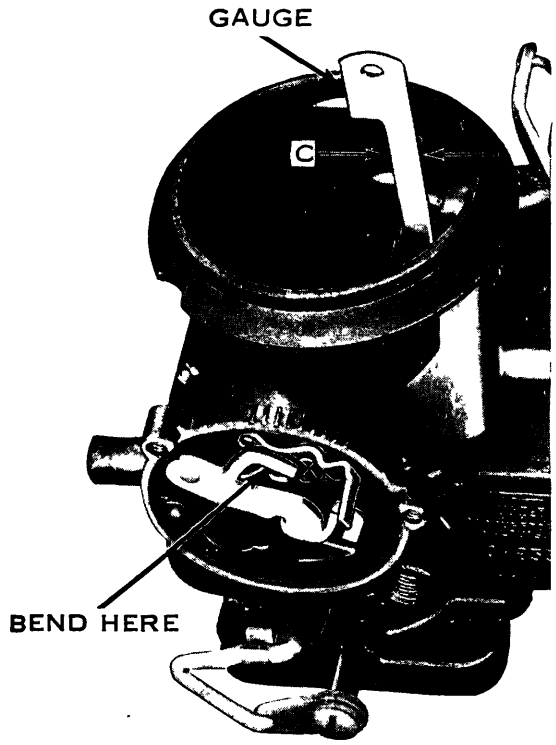

Figure 4
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 4):

This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 1/4 inch clearance (C) (use gauge T109-31) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on choke trip lever (use Tool T109-214). When fast idle and unloader adjustments have been made, assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn. Set Climatic® Control at "Index", making sure that hook on coil has picked up coil shaft lever.

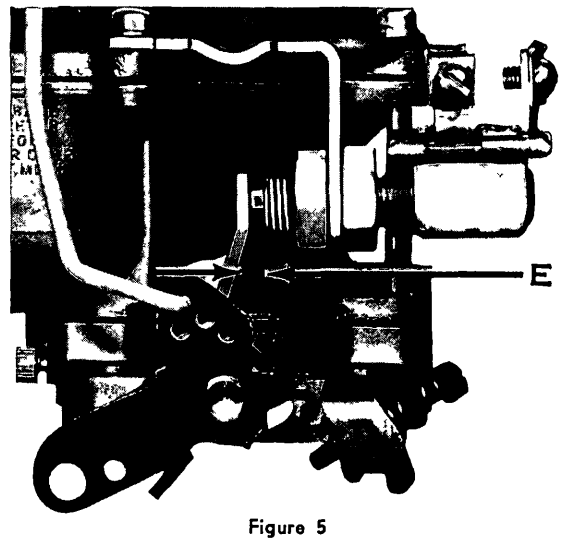

Figure 5
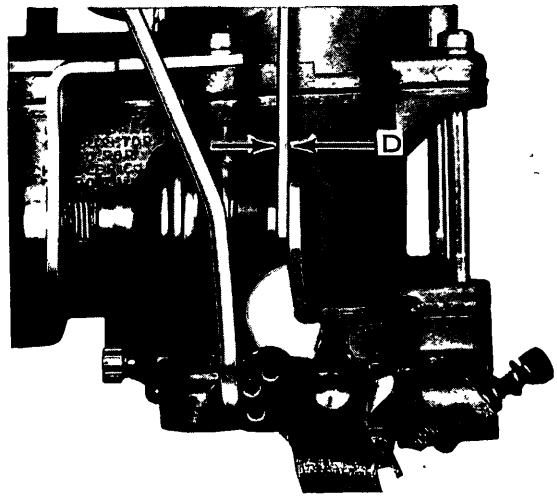
Overdrive Kickdown Switch Adjustment

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT (Fig. 5):

With throttle valves in wide open position adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance (E) between kickdown lever and switch stem guide.

NOTE: If necessary bend kickdown lever to contact switch stem as shown.



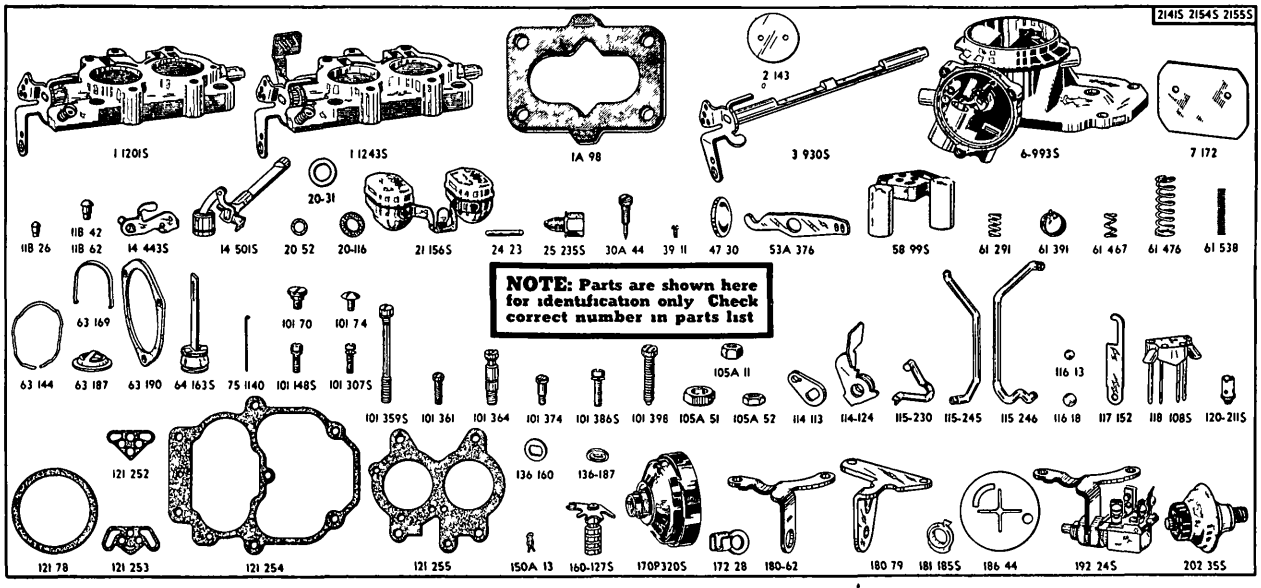


Figure 6
Dashp t Adjustment

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT (Fig. 6):

The purpose of this unit is to prevent the car from stalling when the throttle is released rapidly. Maximum action is obtained by loosening lock nut and adjusting the dash-pot unit so that the plunger shaft can be bottomed with a 1/16 inch gauge placed between shaft and operating lever (D) with throttle valves tightly closed. Then tighten lock nut.

CARBURETER ADJUSTMENTS

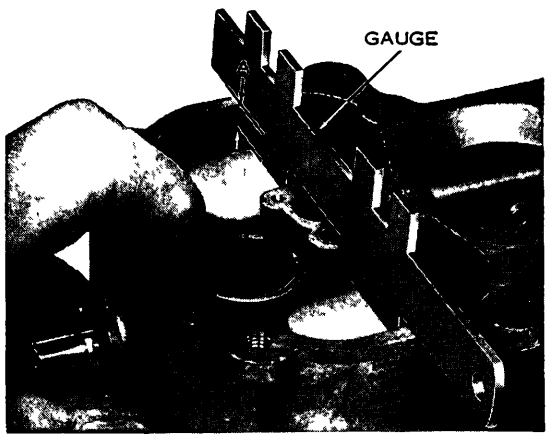

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance (A) from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109-239). If one float is lower than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats

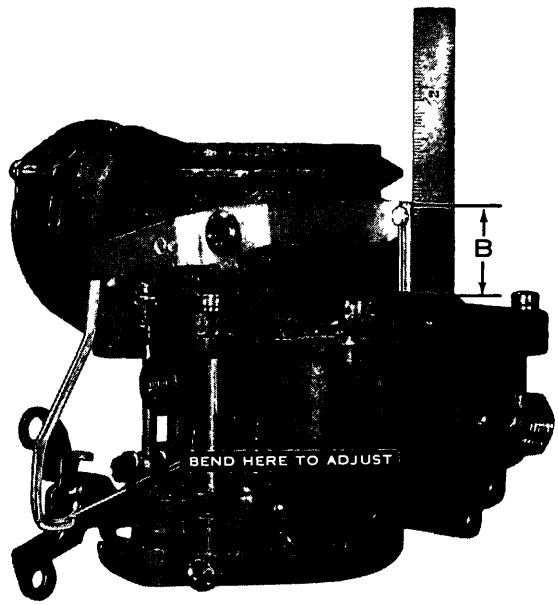

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig. 2):

Back out throttle adjusting screw and open choke valve so that throttle valve seats in bore of carbureter. Install throttle connector rod in center hole of throttle lever. The distance (B) from the top of the bowl cover to the top of plunger shaft (not pump arm) should be 54/64 inch. Adjust by bending throttle connector rod at lower angle (use Tool T109-213).

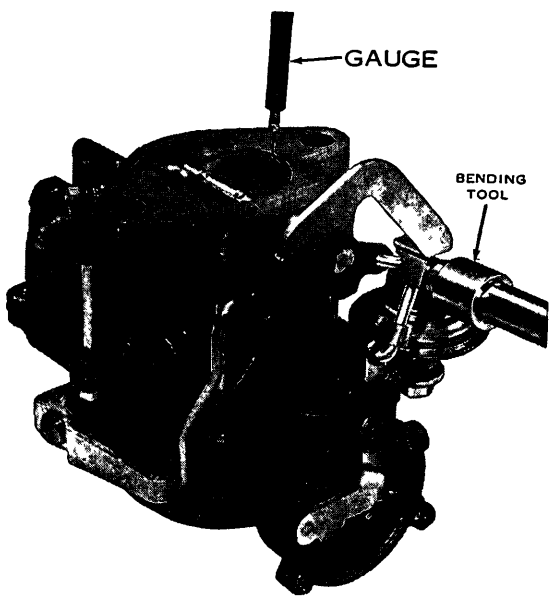

Figure 3
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 3):

Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position Then close throttle. This will allow fast idle cam to revolve to fast idle position. There should now be .022-.026 inch clearance (use gauge T109-29) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle (use tool T109-213).

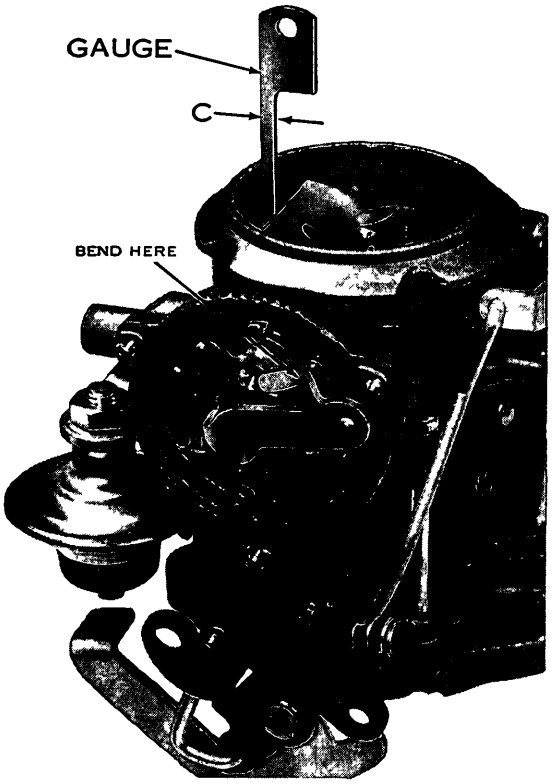

Figure 4
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 4):

This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 9/64 inch clearance (C) (use gauge T109-34) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on choke trip lever (use tool T109-214). When fast idle and unloader adjustments have been made, assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn. Set Climatic® Control as specified making sure that hook on coil has picked up coil shaft lever.

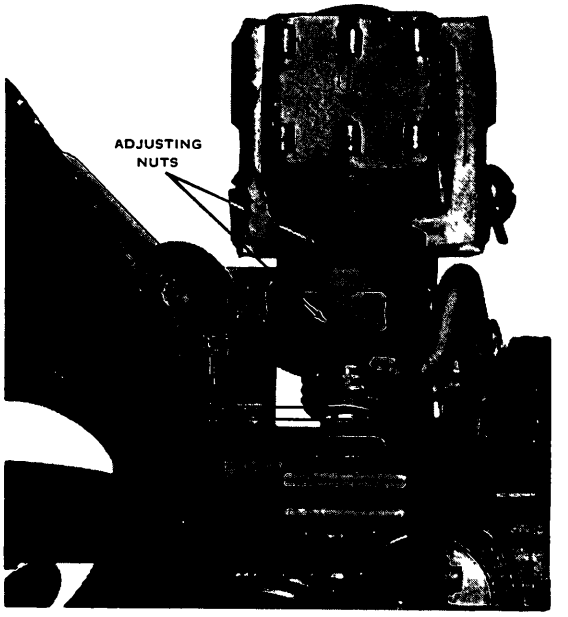

Figure 5
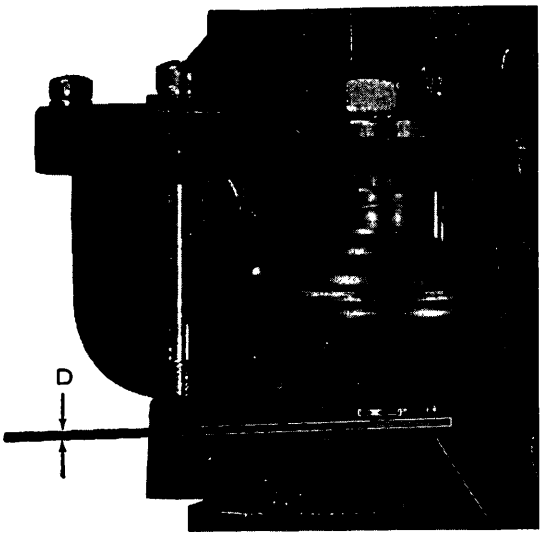
Overdrive Kickdown Switch Adjustment

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT (Fig 5):

With throttle valve in wide open position adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance (E) between kickdown lever and switch stem guide.



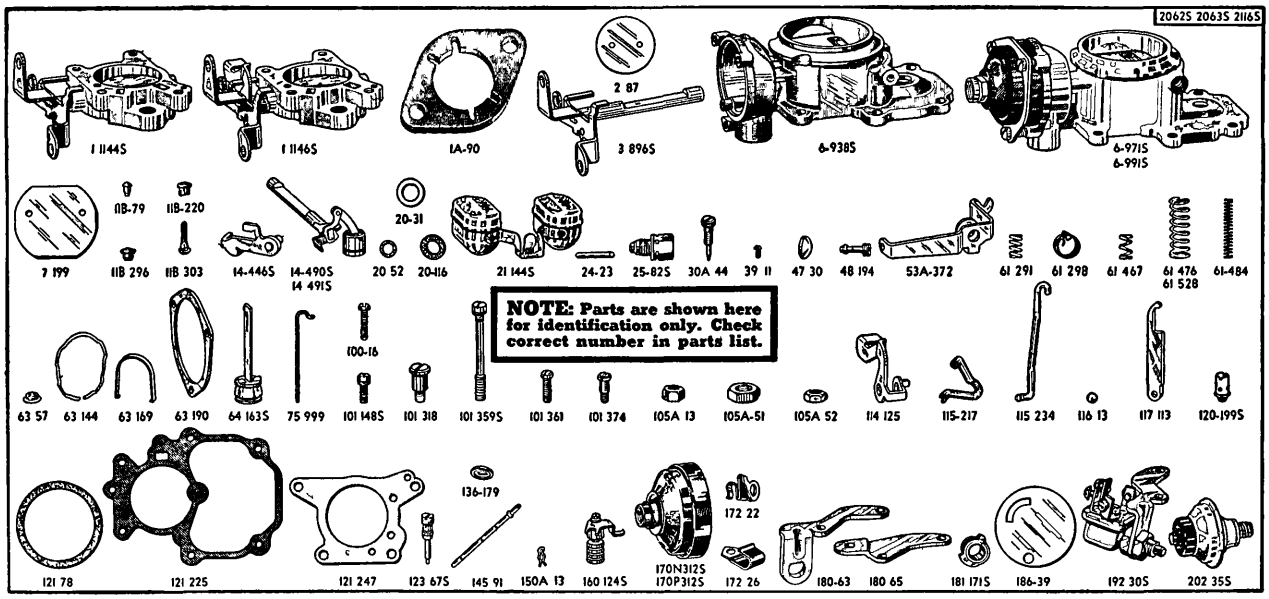


Figure 6
Dashpot Adjustment

DASHPOT (SLOW CLOSING THROTTLE) ADJUSTMENT (Fig. 6):

The purpose of the dashpot is to prevent the car from stalling when the throttle is released rapidly. Maximum dashpot action is obtained by loosening lock nut and adjusting the dashpot unit so that the dashpot plunger shaft can be moved inward approximately 3/32 inch (D) with the throttle valve tightly closed. Then tighten lock nut.

CARBURETER ADJUSTMENTS

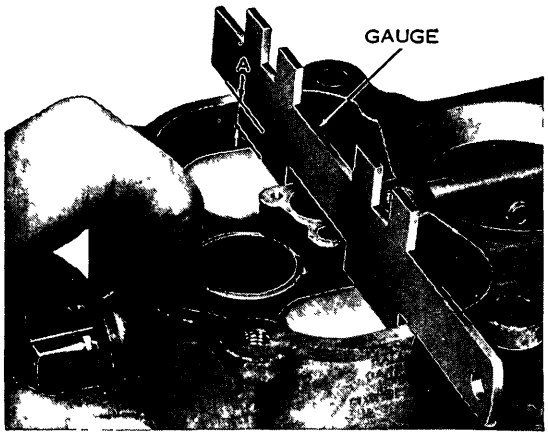

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance (A) from the top surface of the body casting to the top of each float should be 7/32 inch (gauge T109-239). If one float is lower than the other, equalize by bending the float arm. If both floats require the same correction, adjust by bending lip on float arm. The floats must not rub anywhere against the inner walls of the bowl. If necessary, bend float arms slightly to provide clearance on all sides of floats.

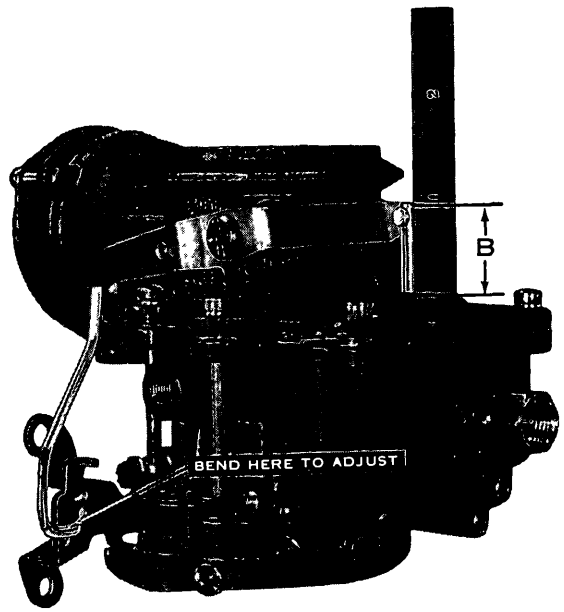

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig. 2):

Back out throttle adjusting screw and open choke valve so that throttle valve seats in bore of carbureter. Install pump connector rod in center hole of throttle lever. The distance (B) from the top of the bowl cover to the top of plunger shaft (not pump arm) should be (920S-993S-994S) 54/64 inch, (920SA-993SA-994SA-2248S) 59/64 inch. Adjust by bending pump connector rod at lower angle (use Tool T109-213).

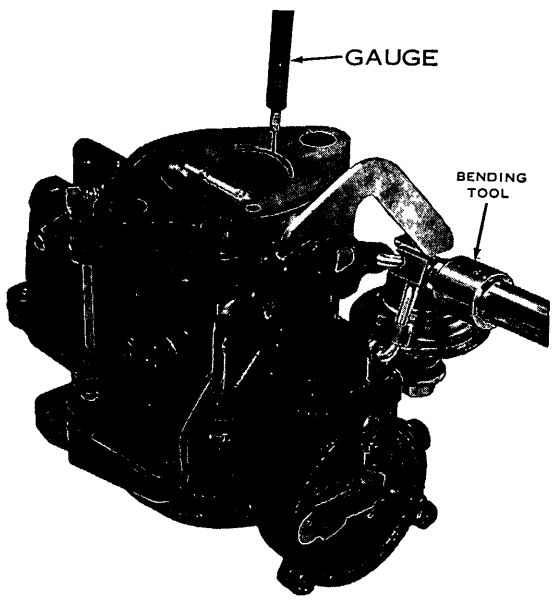

Figure 3
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 3):

Remove thermostatic coil housing assembly, gasket and baffle plate. With throttle adjusting screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position. There should now be .019 inch - .023 inch clearance (use gauge T109-29) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle (use tool T109-213).

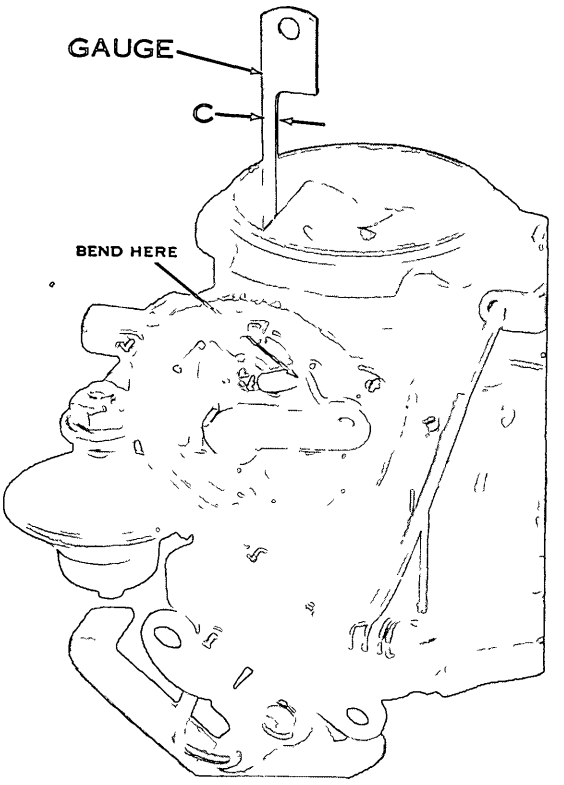

Figure 4
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 4):
This adjustment must be made after the fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 9/64 inch clearance (C) (use gauge T109-34) between upper edge of choke valve and inner wall of air horn. Adjust by bending arm on choke trip lever (use tool T109-214). When fast idle and unloader adjustments have been made, assemble baffle plate, coil housing gasket and thermostatic coil housing assembly on air horn. Set Climatic® Control at "Index" making sure that hook on coil has picked up coil shaft lever.

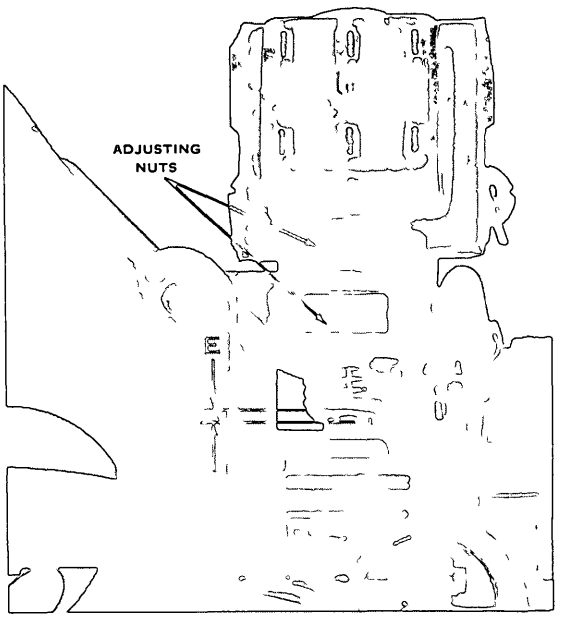

Figure 5
Overdrive Kickdown Switch Adjustment

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT (Fig. 5):
With throttle valve in wide open position adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance (E) between kickdown lever and switch stem guide.

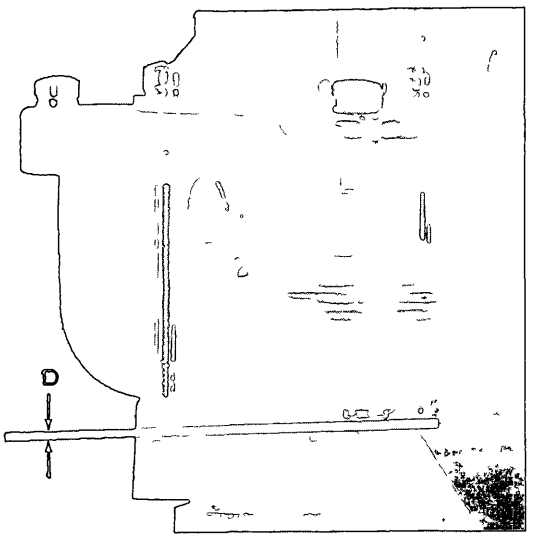

Figure 6
Dashpot Adjustment

DASHPOT (SLOW CLOSING THROTTLE) ADJUSTMENT (Fig. 6):
The purpose of the dashpot is to prevent the car from stalling when the throttle is released rapidly. Maximum dashpot action is obtained by loosening lock nut and adjusting the dashpot unit so that the dashpot plunger shaft can be moved inward approximately 3/32 inch (D) with the throttle valve tightly closed. Then tighten lock nut.

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service check float level Wear on lip of float lever will raise float level Before adjusting float, be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling set throttle lever adjusting screw so motor runs between 450-500 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble remove idle orifice tube and plug assembly Clean tube and passages with compressed air

If acceleration is not satisfactory, remove pump jet and clean with compressed air However it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is

PRINTED IN U S A

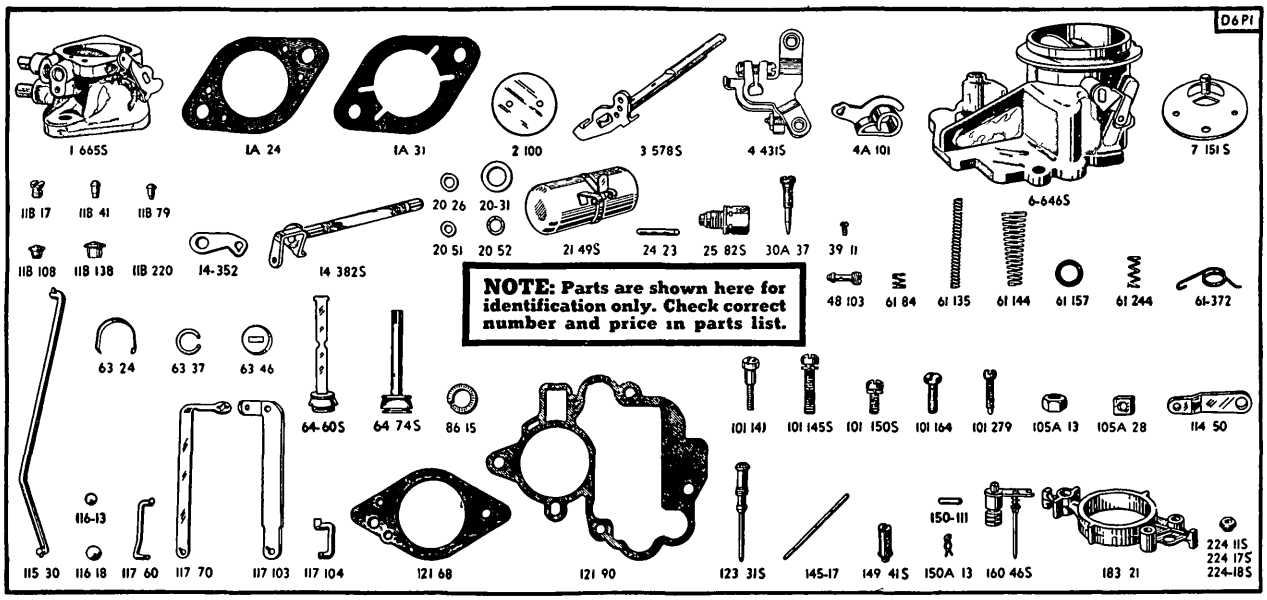
removed from cylinder use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a "balance tube' in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43 main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment Remove air horn assembly, back out throttle adjustment screw and be sure pump operating link is in center hole of throttle shaft arm Place universal pump travel gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts top of plunger shaft with throttle valve seated Take reading indicated on gauge Repeat with throttle valve wide open and plunger pushed to bottom of cylinder The difference in reading obtained should be "22' (22/64") plunger travel

Adjust by bending horizontal portion of pump lifter link



Pump stroke adjustable for high or low temperatures Set to longest stroke for cold weather, shorter stroke for hot weather driving

Dash-Pot Adjustment Engines operating in connection with fluid couplings frequently tend to stall during rapid deceleration unless the throttle closes slowly Slow throttle movement is necessary only during the last part of the closing The dash-pot or decelerating pump acts as a snubber to the throttle allowing fast movement to almost closed position, then slow closing from that point to the idle position

When the throttle is released, the throttle valve closes rapidly until throttle shaft arm contacts the dash-pot pick-up arm Then the dash-pot plunger must be pushed to the bottom of the cylinder before the throttle can close A ball check located in the lower end of the plunger shaft seals the larger upper opening and the gasoline must leave the cylinder through the small metered hole in lower part of the shaft

This reduces the rate at which plunger can be forced to the bottom of the cylinder making the last part of the throttle closing very slow **The adjusting screw (in top of bowl cover) should be opened 5 turns for D6P1 or 4½ turns for D6P2 from closed position** for average conditions Under extreme driving conditions greater openings may be necessary, although extreme dash-pot action will affect gear changes, and not enough action will allow engine to stall

Be sure plunger leather is soft and pliable and effects a good seal against the cylinder wall

Use D6H2 and 195-63U to replace D6U1

BB DOWN-DRAFT CARBURETER—**MODEL D6U1**

CARBURETER SPECIFICATIONS

For Plymouth Six Cylinder Engine: 3¼ Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Throttle bore, 1-9/16 inch.
Main venturi, 1¼ inch I. D.

Float Setting: See adjustments.

Vents: Outside, none. Inside, balance vent tube.

Gasoline Intake: Size No. 44 (.086 inch) drill in needle seat.

Idle Orifice Tube: Jet, size .0276 inch.
Idle passage air bleed (in air horn), size .065 inch.
Restriction in body, size .056 to .057 inch diameter.

Idle Port: Upper port, slot type, length .149 inch; width, .030 inch.

Idle Port Opening: Top of port located .118 to .122 inch above top edge of valve, with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size, .053 to .057 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Idle engine between 450-500 r.p.m.

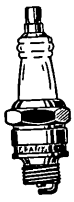
Main Metering Jet: Calibrated to flow 287 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl) size .0315 inch drill.

Main Vent Tube: Side holes, 6—.0354 inch diameter.

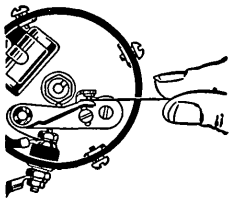
Step-Up Jet: Size .0295 inch diameter.

Accelerating Pump: Pump intake passage, ball check seat, size .115 to .120 inch diameter.
Pump discharge passage, restriction (under ball check), size .062 to .065 inch diameter in body.
Pump (discharge) jet, size .0276 inch drill.



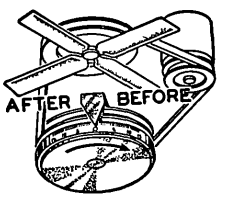
Pump Adjustment: See adjustments.

Choke: Butterfly type, with poppet valve. Inter-connected to open throttle valve to fast idle position when choke is used.

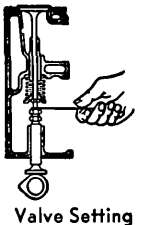


Vacuum Spark Port: Slot (round end) type. Size .040 by .110 inch. Bottom of port, .021 to .027 inch above top edge of valve, with valve tightly closed.

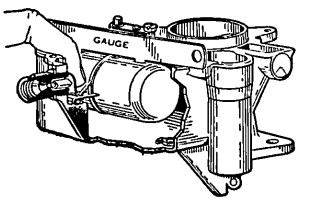
Motor Tune-Up—Be Accurate!



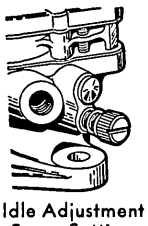
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: 2° B. T. C.

Valve Setting (Hot) Intake .010" Exhaust .010"

Float Setting 5/64 Inch (Use Gauge T109-50)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: This adjustment must be made with the bowl cover gasket and float pin retainer removed. Hold the lip on float arm against the seated intake needle, making sure the float pin is at the bottom of its guide slots. The distance from the top surface of the body casting to the top of the float should be 5/64 inch (gauge T109-50). To adjust bend lip on float arm.

PUMP ADJUSTMENT: Remove air horn assembly, back out throttle adjustment screw and be sure pump operating link is in center hole of throttle shaft arm. Place Universal pump travel gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft. With throttle valve seated turn knurled nut of gauge until lip contacts top of plunger shaft. Take reading indicated on gauge. Repeat with throttle valve wide open and plunger pushed to bottom of cylinder. The difference in reading obtained should be "22" (22/64") plunger travel. Adjust by bending horizontal portion of pump lifter link.

Pump stroke adjustable for high or low temperatures. Set to longest stroke for cold weather, shorter stroke for hot weather driving.

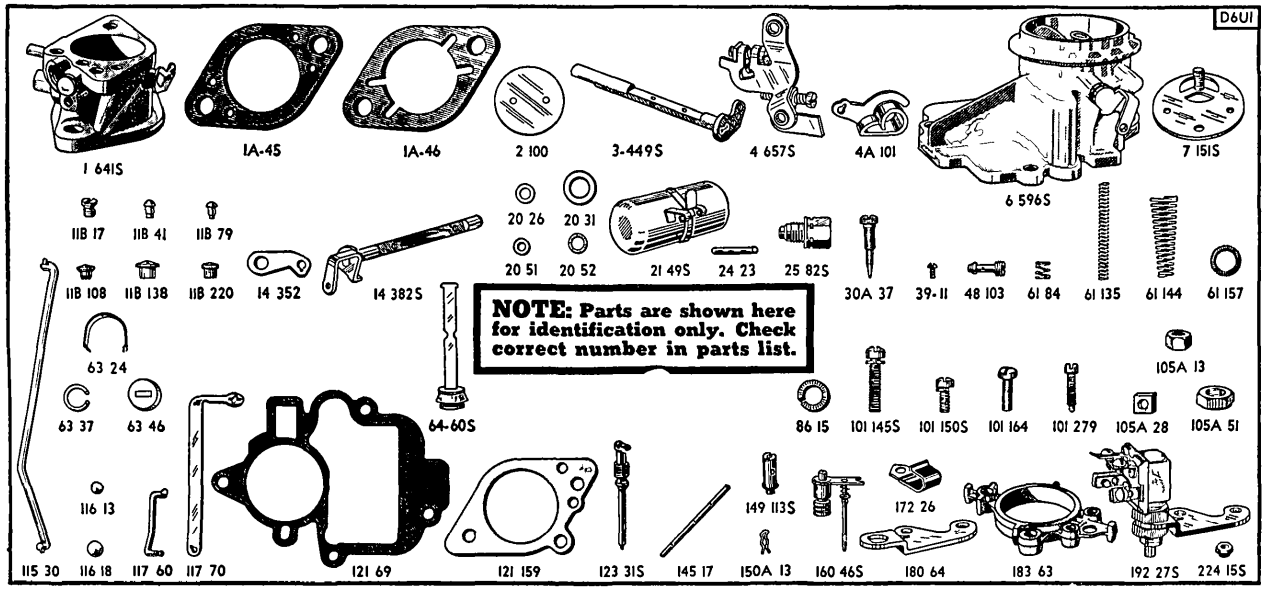
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

OVERDRIVE KICKDOWN SWITCH ADJUSTMENT: With throttle valve in wide open position, adjust hex nuts on switch to have 1/64 inch to 3/64 inch clearance between kickdown lever and switch stem guide

EXCESSIVE RICHNESS above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-210 main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

MAXIMUM ECONOMY and performance are secured only when breaker points, spark plugs, valves and motor timing are set to manufacturer's specifications After motor is properly tuned the following should also be done to insure satisfactory performance and economy



(a) Float level must be set as above

(b) Step-up rod in step-up jet must seat and move freely When reassembling, jet must be screwed in tight against seat

(c) Step-up piston in body casting should not bind and must be free of dirt

(d) Main metering jet can be replaced with leaner than standard metering jets, for altitude

CAUTION: Do not attempt to gauge metering jets with drills These jets have been flow-tested to insure correct fuel flow

BB DOWN-DRAFT CARBURETER **No. D6R1**

CARBURETER SPECIFICATIONS

For Plymouth Six Cylinder Engine: 3¼ Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Throttle bore, 1-9/16 inch.
Main venturi, 1¼ inch I. D.

Float Setting: Top of float 5/64 inch plus or minus 1/64 inch below top surface of carbureter body casting.

Vents: Outside, none. Inside balance vent tube.

Gasoline Intake Needle: Triangular, horizontal. No. 44 (.086 inch) drill in needle seat.

Idle Orifice Tube: Jet size, .0276 inch. Idle passage air bleed (in air horn), size .065 inch. Restriction in body, size .056 to .057 inch diameter.

Idle Port: Upper port, slot type; length .149 inch; width, .030 inch. Top of port located .118 to .122 inch above top edge of valve. Lower port: (For Idle Adjustment Screw) Size, .053 to .057 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Idle engine between 450-500 r.p.m.

Main Metering Jet: Calibrated to flow 287 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl) size .0315 inch drill.

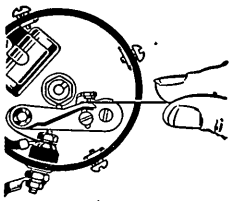
Main Vent Tube: Side holes, 6—.0354 inch diameter.

Step-Up Jet: Size .0295 inch diameter.

Accelerating Pump: Type, delayed action. Stroke, summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke).
Pump intake passage, ball check seat, size .115 to .120 inch diameter.
Pump discharge passage; restriction (under ball check), size .062 to .065 inch diameter in body.
Pump (discharge) jet, size .0276 inch drill.

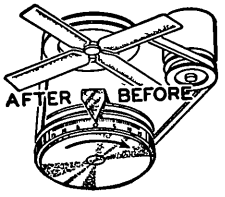
Pump Adjustment: 22/64" plunger travel (center hole). Use gauge No. T109-117S.

Choke: Butterfly type, with poppet valve. Inter-connected to open throttle valve to fast idle position when choke is used.

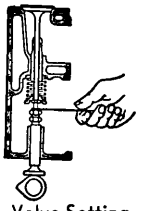


Vacuum Spark Port: Slot (round end) type. Size .040 by .110 inch. Bottom of port, .021 to .027 inch above top edge of valve.

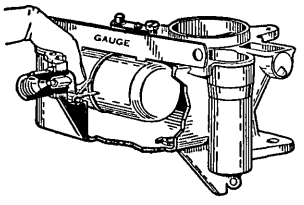
Motor Tune-Up—Be Accurate!



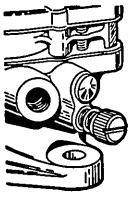
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: 2° B.T.C.

Valve Setting (Hot) Intake .010" Exhaust .010"

Float Setting 5/64 Inch (Use Gauge T109-50)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CABURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450-500 r.p.m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube and passages with compressed air.

If acceleration is not satisfactory remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

Correct air fuel ratio is provided by a "balance tube" in the air horn. The balance tube should be checked each time the carbureter is serviced to see that the passage is open. The

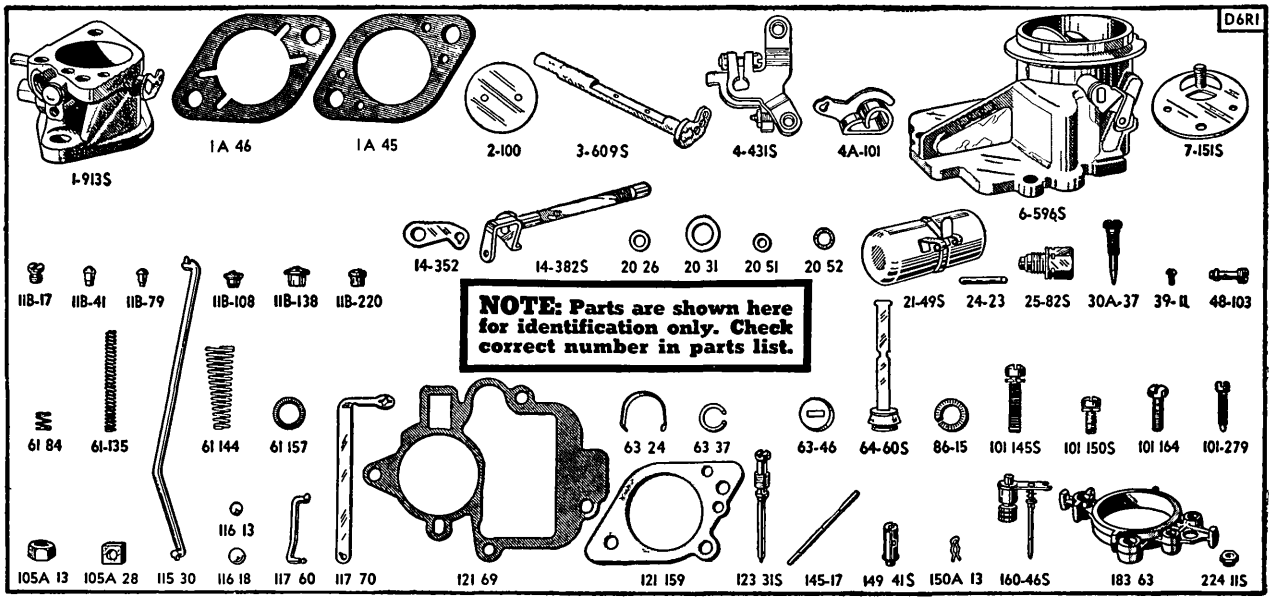
MARCA REGISTRADA

PRINTED IN U.S.A.

object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-210, main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation



Pump Adjustment Remove air horn assembly, back out throttle adjustment screw and be sure pump operating link is in center hole of throttle shaft arm Place Universal pump travel gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts top of plunger shaft with throttle valve seated Take reading indicated on gauge Repeat with throttle valve wide open and plunger pushed to bottom of cylinder The difference in reading obtained should be "22" (22/64") plunger travel

Adjust by bending horizontal portion of pump lifter link Pump stroke adjustable for high or low temperatures Set to longest stroke for cold weather, shorter stroke for hot weather driving

Maximum economy and performance are secured only when breaker points, spark plugs valves and motor timing are set to manufacturer s specifications After motor is properly tuned the following should also be done to insure satisfactory performance and economy

(a) Float level must be set as above
(b) Step-up rod in step-up jet must seat and move freely When reassembling jet must be screwed in tight against seat
(c) Step-up piston in body casting should not bind and must be free of dirt
(d) Main metering jet can be replaced with leaner than standard metering jets, for altitude

CAUTION· Do not attempt to gauge metering jets with drills These jets have been flow-tested, to insure correct fuel flow

B-B DOWN-DRAFT CARBURETERS—**MODELS D6N1-D6N2**

CARBURETER SPECIFICATIONS

For Plymouth Six Cylinder Engine: 3¼ Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E. Throttle bore, 1-9/16 inch (39.69 mm). Main venturi, 1¼ inch (31.75 mm) I. D.

Float Setting: Top of float 5/64 inch (1.98 mm) plus or minus 1/64 inch (.397 mm) below top surface of carbureter body casting.

Vents: Outside, none. Inside balance vent .218 inch (5.54 mm) diameter.

Gasoline Intake Needle: Triangular, horizontal. (Early production) No. 44 (2.18 mm) drill. (Late production) No. 48 (1.93 mm) drill.

Idle Orifice Tube: Jet size, .0276 inch (.70 mm). Idle passage air bleed (in air horn), size .065 inch (1.65 mm). Restriction in body, size .054 to .055 inch (1.37 to 1.39 mm) diameter.

Idle Ports: Upper port, slot type; length .149 inch (3.789 mm); width, .030 inch (.76 mm). Top of port located .118 to .122 inch (2.997 to 3.099 mm) above top edge of valve. Lower port, (for idle adjustment screw) size, .053 to .057 inch (1.35 to 1.45 mm) diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Idle engine between 450-500 r.p.m.

Main Metering Jet: Calibrated to flow 256 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl) size .0315 inch (.80 mm) drill.

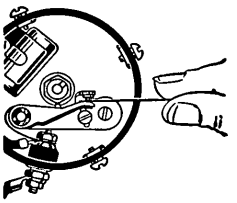
Main Vent Tube: Side holes, 6—.0354 inch diameter.

Step-Up Jet: No. 71 (.66 mm) drill size.

Accelerating Pump: Type, delayed action. Stroke, summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke). Pump intake passage, ball check seat, size .107 to .112 inch (2.72 to 2.845 mm) diameter. Pump discharge passage; restriction (under ball check), size .062 to .065 inch (1.58 to 1.65 mm) diameter in body. Pump (discharge) jet, size .0276 inch (.70 mm) drill.

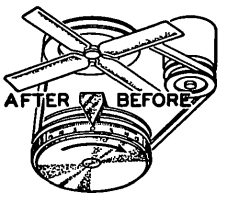
Pump Adjustment: 22/64 inch (8.731 mm) plunger travel (center hole). Use gauge No. T109-117S.

Choke: Butterfly type, with poppet valve. Inter-connected to open throttle valve to fast idle position when choke is used.

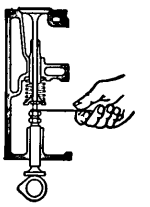


Vacuum Spark Port: Slot (round end) type. Size .040 by .110 inch (1.016 to 2.794 mm). Bottom of port, .021 to .027 inch (.533 to .686 mm) above top edge of valve.

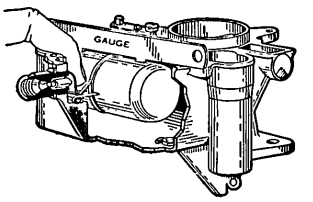
Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



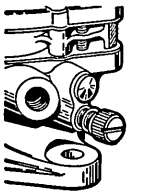
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open 2° B.T.C.

Valve Setting (Hot) Intake .010" Exhaust .010"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

The ignition timing should be advanced to 2° B.T.D.C. with most standard grade fuels. If too much detonation is encountered with a given fuel, the timing may be retarded sufficiently so that a very slight ping is audible when accelerating from 10 to 30 m.p.h. with wide open throttle.

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450-500 r.p.m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube and passages with compressed air.

Correct air fuel ratio is provided by a "balance tube" in the air horn. The balance tube should be checked each time the

Standard Clutch and Transmission

PLYMOUTH 1949-1954

B-B DOWN-DRAFT CARBURETERS—**MODELS D6H1-D6H2**

CARBURETER SPECIFICATIONS

For Plymouth Six Cylinder Engine: 3¼ Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size, 1½ inch S. A. E.
Throttle bore, 1-9/16 inch (39.69 mm).
Main venturi, 1¼ inch (31.75 mm) I. D.

Float Setting: Top of float 5/64 inch (1.98 mm) plus or minus 1/64 inch (.397 mm) below top surface of carbureter body casting.

Vents: Outside, none. Inside balance vent .218 inch (5.54 mm) diameter.

Gasoline Intake Needle: Triangular, horizontal. No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .0276 inch (.70 mm). Idle passage air bleed (in air horn), size .065 inch (1.65 mm). Restriction in body, size, .054 to .055 inch (1.37 to 1.39 mm) diameter (D6H1-D6H2 early production); .056 to 0.57 inch (1.42 to 1.44 mm) diameter D6H2 late production).

Idle Ports: Upper port, slot type; length .149 inch (3.789 mm); width, .030 inch (.76 mm).
Top of port located .118 to .122 inch (2.997 to 3.099 mm) above top edge of valve.
Lower port: (For Idle Adjustment Screw) Size, .053 to .057 inch (1.35 to 1.45 mm) diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Idle engine between 450-500 r.p.m.

Main Metering Jet: Calibrated to flow 287 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl) size .0315 inch (.80 mm) drill.

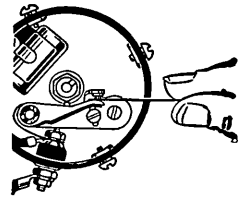
Main Vent Tube: Side holes, 6—.0354 inch diameter.

Step-Up Jet: Size .0295 inch diameter.

Accelerating Pump: Type delayed action. Stroke, summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke).
Pump intake passage, ball check seat, size .115 to .120 inch (2.93 to 3.05 mm) diameter.
Pump discharge passage; restriction (under ball check), size .062 to .065 inch (1.58 to 1.65 mm) diameter in body.
Pump (discharge) jet, size .0276 inch (.70 mm) drill.

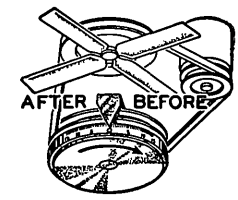
Pump Adjustment: 22/64" (8.731 mm) plunger travel (center hole). Use gauge No. T109-117S.

Choke: Butterfly type, with poppet valve. Inter-connected to open throttle valve to fast idle position when choke is used.

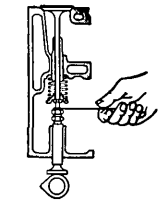


Vacuum Spark Port: Slot (round end) type. Size .040 by .110 inch (1.016 to 2.794 mm). Bottom of port, .021 to .027 inch (.533 to .686 mm) above top edge of valve.

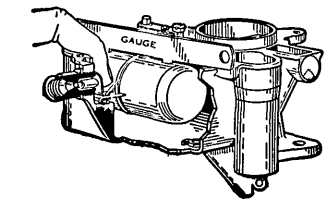
Motor Tune-Up—Be Accurate!



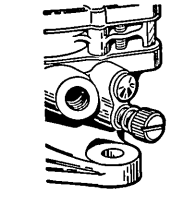
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .035"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open 2° B.T.C.

Valve Setting (Hot) Intake .010" Exhaust .010"

Float-Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs between 450-500 r.p.m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube and passages with compressed air.

If acceleration is not satisfactory remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

Correct air fuel ratio is provided by a "balance tube" in the air horn. The balance tube should be checked each time the

MARCA REGISTRADA

PRINTED IN U.S.A.

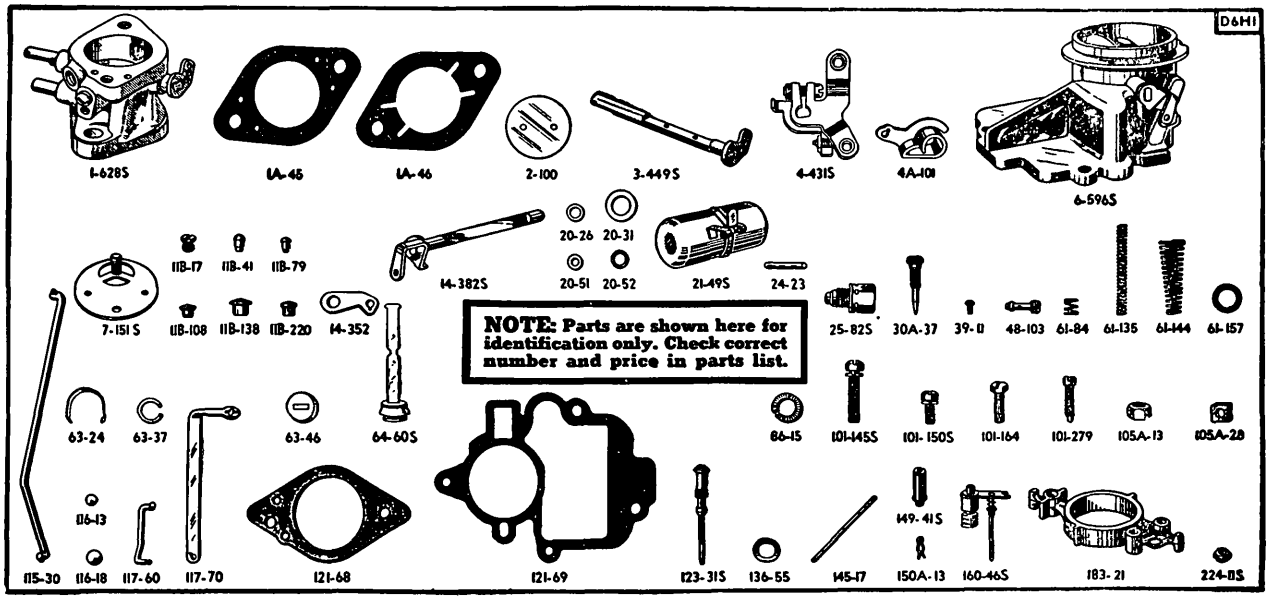
carbureter is serviced to see that the passage is open. The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner. Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed.

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube. After removal of rivet plug beneath float bowl with tool No. T109-43, main vent tube can be removed and a new tube inserted with tool No. T109-195. Care must be exercised in inserting new tube which must seat tightly. Use new rivet to complete the installation.

Pump Adjustment: Remove air horn assembly, back out throttle adjustment screw and be sure pump operating link is in center hole of throttle shaft arm. Place Universal pump travel gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft. Turn knurled nut of gauge until lip contacts top of plunger shaft with throttle valve seated. Take reading indicated on gauge. Repeat with throttle valve wide open and plunger pushed to bottom of cylinder. The difference in reading obtained should be "22" (22/64") plunger travel.

Adjust by bending horizontal portion of pump lifter link. Pump stroke adjustable for high or low temperatures. Set to longest stroke for cold weather, shorter stroke for hot weather driving.

Maximum economy and performance are secured only when breaker points, spark plugs, valves and motor timing are set to manufacturer's specifications. After motor is properly tuned the following should also be done to insure satisfactory performance and economy:



(a) Float level must be set as above.

(b) Step-up rod in step-up jet must seat and move freely. When reassembling, jet must be screwed in tight against seat.

(c) Step-up piston in body casting should not bind and must be free of dirt.

(d) Main metering jet can be replaced with leaner than standard metering jets, for altitude.

CAUTION: Do not attempt to gauge metering jets with drills. These jets have been flow-tested, to insure correct fuel flow.

B-B DOWN-DRAFT CARBURETER—**MODEL D6G1**

CARBURETER SPECIFICATIONS

For Plymouth Six Cylinder Engine: 3 1/4 Inch Bore, 4 3/8 Inch Stroke

Dimensions: Flange size, 1 1/2 inch S. A. E.
Throttle bore, 1-9/16 inch (39.69 mm).
Main venturi, 1 1/4 inch (31.75 mm) I. D.

Float Setting: Top of float 5/64 inch (1.98 mm) plus or minus 1/64 inch (.397 mm) below top of surface of carbureter body casting.

Vents: Outside, none. Inside balance vent .218 inch (5.54 mm) diameter.

Gasoline Intake Needle: Triangular, horizontal. No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .0295 inch (.75 mm). Idle passage air bleed (in body), size .067 inch (1.70 mm). Idle restriction in body, size .054 to .055 inch (1.37 to 1.39 mm) diameter.

Idle Ports: Upper port, keyhole type: length .160 inch (4.06 mm); width, .030 inch (.76 mm); .045 inch (1.14 mm) diameter hole at top.
Top of port located .118 to .122 inch (3.00 to 3.10 mm) above top edge of valve (early production); .128 to .132 inch (3.251 to 3.353 mm) above top edge of valve (late production).
Lower port: (For Idle Adjustment Screw) Size, .053 to .057 inch (1.35 to 1.45 mm) diameter.

Set Idle Adjustment Screw: 1/2 to 1 1/4 turns open. For richer mixture, turn screw out. Do not idle engine below 300 r.p.m. or 6 miles per hour.

Main Metering Jet: Calibrated to flow 254 to 258 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl) size .0315 inch (.80 mm) drill.

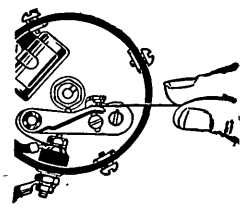
Main Vent Tube: Side holes, 6—.0354 inch diameter.

Step-Up Jet: No. 63 (.94 mm) drill size.

Accelerating Pump: Type, delayed action. Stroke, summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke).
Pump intake passage, ball check seat, size .115 to .120 inch (2.93 to 3.05 mm) diameter.
Pump discharge passage; restriction (under ball check), size .062 to .065 inch (1.58 to 1.65 mm) diameter in body.
Pump (discharge) jet, size .0276 inch (.70 mm) drill.

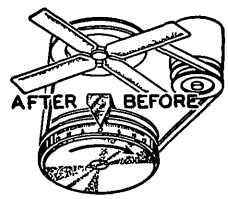
Pump Adjustment: 22/64" (8.73 mm) plunger travel (center hole). Use gauge No. T109-117S.

Choke: Butterfly type, with poppet valve. Inter-connected to open throttle valve to fast idle position when choke is used.

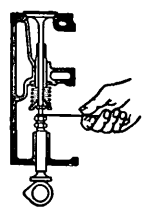


Vacuum Spark Port: Slot (round end) type. Size .040 by .110 (1.016 to 2.794 mm). Bottom of port .003 to .009 inch (.076 to .229 mm) and .019 to .025 inch (.482 to .635 mm) (early production), .021 to .027 inch (.533 to .688 mm) (late production) above top edge of valve.

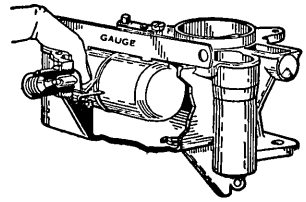
Motor Tune-Up—Be Accurate!



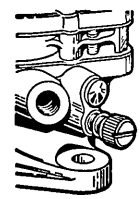
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: 3° B. T. D. C.

Valve Setting (Hot) Intake .008" Exhaust .010"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting 1/2 to 1 1/4 Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 300 r. p. m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube and passage with compressed air.

If acceleration is not satisfactory remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

Correct air fuel ratio is provided by a "balance tube" in the air horn. The balance tube should be checked each time the carbureter is serviced to see that the passage is open. The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner. Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed.

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube. After removal of rivet plug beneath float bowl with tool No. T109-43, main vent tube can be removed

CARBURETER SPECIFICATIONS

For Plymouth Six Cylinder Engine· 3¼ Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size 1¼ inch S A E
Primary venturi, 11/32 inch I. D
Secondary venturi, 11/16 inch I D.
Main venturi, 1¼ inch I D

Float Level: Distance from float (at free end) to float chamber cover, when needle is seated to be ½ inch plus or minus 1/64 inch

Vents: Outside none Inside balance vent tube above choke valve 13/64 inch I. D.

Gasoline Intake: Square vertical needle Size No 48 drill hole in needle seat.

Low Speed Jet Tube: Vertical jet size, 039 inch diameter.
By-pass in body, size No. 51 drill
Economizer jet, size 0545 to 0555 inch diameter

Idle Ports: Upper port diameter, No 44 drill
Lower port diameter, No 54 drill

Idle Port Opening: Top of lower port 044 to 048 inch above top edge of valve, with valve closed tight

Idle Screw Seat: Size No 52 drill

Set Idle Adjustment Screw 1¼ to 2¼ turns open For richer mixture turn screw out Do not attempt to idle engine below 350 r p m

Outer Nozzle. In primary venturi angle 30° Discharge size 125 inch diameter

Inner Nozzle· (Seats in outer nozzle) 120 inch I D

Nozzle Retainer Plug· Jet size No 31 drill

Metering Rod: Economy step 067 inch diameter Second step tapers to 062 inch diameter Third step tapers to 060 inch diameter Power step 046 inch diameter Length 3⅜ inches

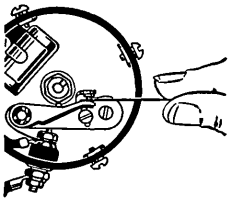
Metering Rod Jet· Size 093 inch diameter

Metering Rod Setting· Use gauge part No T109 25 (2 795 inches)

Accelerating Pump Low pressure type with non adjustable stroke
Discharge jet size No 72 drill
Intake disk check plug size No 62 drill
Discharge disk check plug size No 40 drill

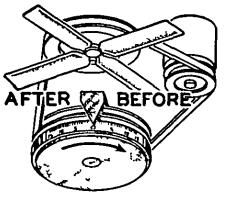
Choke Manual—Butterfly type offset valve

Throttle Valve. Opens to within 0° to 3° from perpendicular



Vacuum Spark Port: Slot type. size, .041 to 125. Bottom of port 000 to 004 above top of valve

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter

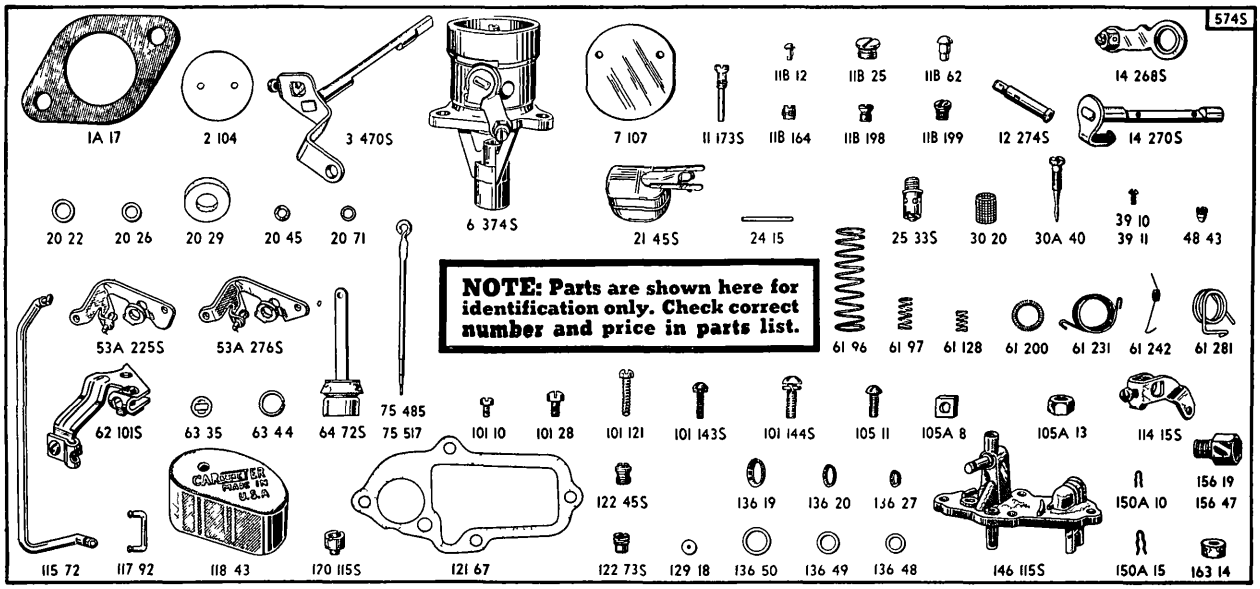
CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

PRINTED IN U.S.A.



CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, float level should be checked Wear on lip of float lever will raise float level Float level may be reset by bending lip of float lever down to raise float level or bending lever up to lower float level Only a very slight bend is needed

If motor stalls while idling, reset idle adjustment screw and throttle lever adjusting screw If these adjustments do not correct the trouble, remove low speed jet tube and clean thoroughly with compressed air Examine and see that tube seats gasoline-tight in body casting, top and bottom If not, replace with a new tube of identical specifications NEVER CHANGE A LOW SPEED JET TUBE FROM ONE CARBURETER TO ANOTHER

Increased resistance on foot throttle indicates a clogged pump jet. Pump jet should be removed and cleaned with compressed air, which, in many cases, will remove the dirt or lint However, it is usually advisable to replace the pump jet, as its cost is nominal All jets and ball checks must be seated gasoline-tight

Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, corrosion in pump cylinder, loose or cracked cylinder, cracked plunger cup or bent pump arm (parts which may be replaced at small cost) If plunger is removed from cylinder, always use loading tool in reassembling to avoid damage to plunger leather

Plymouth—1947— Carbureter 574S

WHEN SERVICING, USE GASKET ASSORTMENT No 138A, REPAIR PACKAGE No ‡1089D

PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No.	PART NAME	
1A-17	FLANGE GASKET	
2 104	Throttle valve	
3-470S	Throttle shaft and lever assembly	
6-374S	Air horn assembly	
7-107	Choke valve	
11-190S	Low speed jet assembly	
11B-12	Rivet plug	(7)
11B-25	Disk check passage plug	
11B-62	Rivet plug	
11B-164	Nozzle plug	
11B-198	Pump jet passage plug	
11B-199	Idle hole passage plug	
12-274S	NOZZLE ASSEMBLY

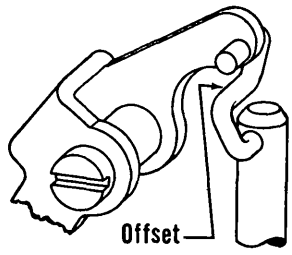
CARBURETER ADJUSTMENTS



Adjustments Illustrated on Service Adjustment Procedure Form 3695

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: (2819S) 21/64 inch (Gauge T109-294); (2820S) 9/32 inch (Gauge T109-126) plus or minus 1/64 inch between top of floats (at outer end) and air horn gasket. NOTE: Gauge should be in line with center of indentation on side of float. To adjust, bend float lever.

FLOAT DROP: 23/32 inch plus or minus 1/16 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 33/64 inch plus or minus 1/64 from the top of the bowl cover to the top of the plunger shaft. (Pump connector link installed with offset toward pump lever.) To adjust, bend throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: .010 inch (Gauge T109-200) plus or minus .005 between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod. NOTE: Choke valve should be held closed by applying pressure to piston lever in piston housing.

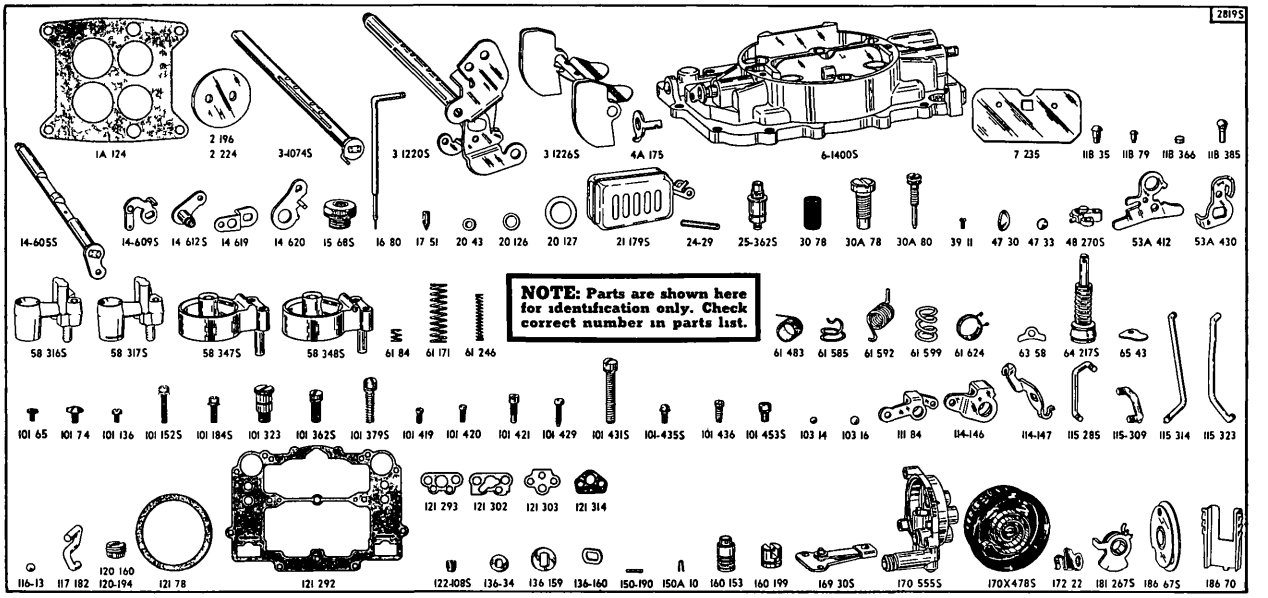
FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed, and trip lever and cam arm in alignment, align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .026 inch (Gauge T109-189) plus or minus .005 inch between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 2200 R. P. M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/8 inch (Gauge T109-36) plus or minus 1/64 inch between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Primary and secondary throttle valves must reach wide open position at the same time. To adjust, bend secondary operating rod. NOTE: At full throttle position secondary throttle valves will be a few degrees from wide open and primary valves will be a few degrees past wide open. 2. With primary and secondary throttle valves tightly closed, there should be .010 inch to .030 inch (Gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.



SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever. NOTE: With carburetor level, auxiliary valves must close from wide open position of their own weight.

IDLE SPEED AND MIXTURE ADJUSTMENT (NORMAL ENGINE TEMP.): In making the idle adjustment on the engine, the air adjustment screw is used to adjust idle speed in a similar manner as the throttle speed screw used previously. Turning the air adjustment screw outward increases engine speed, but also leans the mixture supplied to the manifold which must be compensated for by adjustment of the idle mixture adjusting screws.

GENERAL BULLETIN

CARBURETER CONTRACT ACCOUNTS
FACTORY, P.I. AND P.C.T. GRADUATES

BULLETIN NO. 19 Pontiac

DATE March 18, 1958

SUBJECT: 1958 Pontiac AFB-2767S (4 Bore)
Carbureter - Step-Up Rod Change

A new step-up rod part 16-72 will be used in production of AFB-2767S carbureters code dated "C8" (March 1958) or later.

This change was made to provide a slightly richer part throttle mixture to eliminate surge complaints at light load road speeds up to 60 MPH. Two step-up rods are required for each carbureter. The rods may be changed with the carbureter on the engine by removing the two small cover plates and attaching screws located on top of the air horn.

The 16-72 (.066X.055) step-up rod replaces part 16-60 (.0675X.055) for the standard calibration. Part 16-60 will be used for the one size lean calibration.

An initial shipment of part 16-72 will be made to Carter Central Distributors. Carter warranty is not involved.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3695

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 21/64 inch (Gauge T109-294) between top of floats (at outer end) and air horn gasket. NOTE: Gauge should be in line with center of indentation on side of float. To adjust, bend float lever.

FLOAT DROP: 23/32 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 33/64 inch from the top of the bowl cover to the top of the plunger shaft. To adjust, bend throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: .045 inch (Gauge T109-158) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod.

FAST IDLE LINKAGE ADJUSTMENT: With choke valve tightly closed and lug on outer choke shaft lever contacting stop on inner choke shaft lever align center of fast idle screw with index mark on cam. To adjust, bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .026 inch (Gauge T109-189) between lower edge of valve and bore with adjusting screw on index mark of cam.

FAST IDLE ON CAR: 2200 R. P. M. hot engine with fast idle screw on index mark of cam.

UNLOADER: 1/8 inch (Gauge T109-36) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Primary and secondary throttle valves must reach wide open position at the same time. To adjust, bend secondary operating rod. **NOTE:** At full throttle position secondary throttle valves will be a few degrees from wide open and primary valves will be a few degrees past wide open. 2. With primary and secondary throttle valves tightly closed, there should be .010 inch to .030 inch (Gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.
NOTE: With carburetor level, auxiliary valves must close from wide open position of their own weight.

IDLE SPEED AND MIXTURE ADJUSTMENT (Normal Engine Temp.): In making the idle adjustment on the engine, the air adjustment screw is used to adjust idle speed in a similar manner as the throttle speed screw used previously. Turning the air adjustment screw outward increases engine speed, but also leans the mixture supplied to the manifold which must be compensated for by adjustment of the idle mixture adjusting screws.

TOOLS REQUIRED FOR SERVICING CARBURETERS:

T109-29	.020"-.030" Wire gauge	T109-158	.045" Wire gauge
T109-36	1/8" Unloader gauge	T109-189	.026" Wire gauge
T109-41	Bending tool	T109-213	Bending tool

T109-294 21/64" Float gauge

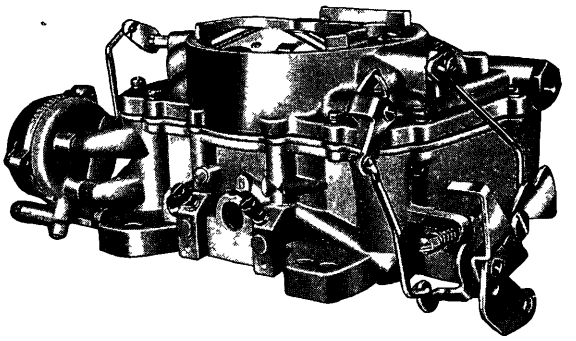
WHEN SERVICING, USE GASKET ASSORTMENT No. 293; RE-CARBURETION KIT No. 1946N



PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF RE-CARBURETION KIT

Part No.	PART NAME	
1A-124	FLANGE GASKET	
2-223	Primary throttle valve	(2)
2-196	Secondary throttle valve	(2)
3-1074S	Secondary throttle shaft and lever assembly	
3-1213S	Auxiliary throttle shaft, valve and weight assembly	
3-1215S	Primary throttle shaft and lever assembly	
4A-175	Primary throttle shaft dog	
6-1372S	Air horn assembly	
7-218	Choke valve	
11B-35	Rivet plug	
11B-79	Rivet plug	(2)
11B-363	Pump intake screw plug (2767S-2768S)	
11B-366	Lead plug	(4)
11B-385	Fuel passage and idle port rivet plug	(3)
14-512	Outside choke shaft lever	
14-550	Inside choke shaft lever	
14-568S	Choke lever and shaft assembly	
14-581S	Choke piston lever, link and pin assembly (Use with 170-494S) (2767S)	
14-609S	Choke piston lever, link and pin assembly (Use with 170-555S)	
14-612S	Choke shaft and lever assembly (piston housing) (Use with 170-555S)	
15-52S	Fuel inlet fitting assembly	
16-60	STEP-UP ROD .0675" x .055" (1 size lean) (2767S-SA)	(2)
16-64	Step-up rod .069" x .058" (2 sizes lean) (2767S-SA)	(2)
16-66U	Step up rod and jet unit (Consists of 2—16-65 and 2—120-175) (3 sizes lean) (2767S-SA)	
16-71	Step-up rod .0685" x .0625" x 055" (standard) (2768S-SA)	(2)
16-72	Step-up rod .066" x 055" (standard) (2767S-SA)	(2)
17-51	Pump discharge check needle	
20-43	Piston housing gasket	
20-126	Needle seat gasket	(2)
20-127	Fuel inlet fitting gasket	
21-179S	Float and lever assembly	(2)
24-29	Float lever pin	(2)
25-324S	NEEDLE AND SEAT ASSEMBLY (.1015")	(2)
30-78	Fuel inlet strainer	
30A-78	Idle air adjustment screw	
30A-80	Idle adjustment screw	(2)
38A-116	Pump intake check ball seat (2767S-2768S)	
39-11	Choke valve attaching screw	(2)
47-30	Piston housing welsh plug	
47-33	Venturi welsh plug	(4)
47-34	Spark port welsh plug	
48-270S	Pump jet and housing assembly (2767S-SA)	
48-258S	Pump jet and housing assembly (2768S-SA)	
53A-412	Lockout dog	
53A-414	Secondary throttle operating lever	
58-196S	Secondary venturi assembly (choke side)

AFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2506S**

CARBURETER SPECIFICATIONS

For Pontiac 8 Cylinder 347 Cu. In. Engine

Dimensions: Flange four bore—4 bolt type
Throttle bore primary, 1 7/16 inch secondary 1-11/16 inch I. D.
Primary venturi size primary side 7/16 inch secondary side 11/32 inch I D
Main venturi size, primary side, 1 3/16 inch secondary side, 1 9/16 inch I D

Vents: Inside (4) in air horn, Outside (5) in air horn (4) in body

Gasoline Intake: Size No 38 (1015 inch) drill hole in needle seat

Low Speed Jet Tube: (In venturi assembly primary side only)
Jet, size No 67 (032 inch) drill
By pass size No 54 (055 inch) drill
Economizer size (049 inch) diameter
Idle bleed size No 55 (052 inch) drill

Idle Port: (Upper) slot type Primary length 180 inch, width 030 inch Secondary none

Idle Port Opening: Primary 147 to 153 inch above top edge of valve with valve tightly closed Secondary none

Set Idle Adjustment Screw: 1 to 2 turns open For richer mixture turn screw out Do not idle engine below 420 440 r p m Transmission in Drive Range For cars with Air Conditioning idle engine between 500 and 520 r p m Air Conditioner unit off Transmission in Drive Range

Main Nozzle: Installed permanently DO NOT REMOVE. Anti-peroclator bleed primary (tube in venturi assembly) size No 70 (028 inch) drill Secondary, (drilled hole in venturi assembly) size No 56 (0465 inch) drill

Secondary Initial Discharge: (In venturi assembly secondary side only)
Pick up tube size (0453 inch) diameter
Air bleed size (0275 inch) diameter
Discharge port size No 56 (0465 inch) drill

Step-Up Rod: (Vacumeter type) see parts list for size

Metering Jet: Primary, size 098 inch diameter (for step-up rod). Secondary size 073 inch diameter (no step up rod)

Accelerating Pump: Discharge jet (twin) primary side only, size No 70 (028 inch) drill Intake ball check seat (screw plug) size 115 to 120 inch diameter Discharge needle seat size No 50 (070 inch) drill

Choke: Carter Climatic® Control set on index Butterfly type —offset choke valve primary side only Choke heat suction hole restriction in body size No 45 (082 inch) drill

Vacuum Spark Port: Round port 059 to 061 inch diameter. Top of port 025 to 035 inch above top edge of valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION. Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .015"	Ignition Timing Breaker Points to Open: 6° B. T. D. C. At Vibration Damper	Float Setting 17/64 Inch (Use Gauge T109-238)	Idle Adjustment Screw Setting 1 to 2 Turns Open 430-450 R.P.M. in Dr. Range

NOTE: These cars are equipped with Hydraulic Valve Lifters—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

Adjustments Illustrated on Service Adjustment Procedure Form 3695

FLOAT ALIGNMENT: Side of floats parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever.

FLOAT LEVEL: 17/64 inch (gauge T109-238) between top of floats (at outer end) and air horn gasket. To adjust, bend float lever.

FLOAT DROP: 3/4 inch between top of floats (at outer end) and air horn gasket. To adjust, bend stop tabs on float brackets.

PUMP: 33/64 inch from the top of the bowl cover to the top of the plunger shaft. To adjust, bend throttle connector rod.

CHOKE PISTON LEVER ADJUSTMENT: .045 inch (Gauge T109-158) between choke lever and stop in piston housing with choke valve closed. To adjust, bend choke connector rod.

CHOKE SHAFT LEVER ADJUSTMENT: .010 inch (Gauge T109-200) between lug on outer choke shaft lever and stop on inner choke shaft lever with choke valve tightly closed and fast idle cam against stop on casting. To adjust, bend fast idle connector rod.

OPTIONAL ADJUSTMENT (Late Prod.): With slight clearance between lug on fast idle cam and stop on flange casting and inner choke shaft lever contacting lug on outer choke shaft lever align index mark on cam with adjusting screw. To adjust bend fast idle connector rod.

FAST IDLE THROTTLE VALVE CLEARANCE: .030 inch (Gauge T109-29) between lower edge of valve and bore with adjusting screw on high step of cam.

FAST IDLE ON CAR: 1900 R.P.M. hot engine with fast idle screw on high step of cam.

UNLOADER: 1/8 inch (Gauge T109-36) between upper edge of choke valve and inner wall of air horn. To adjust, bend unloader lip on throttle lever.

SECONDARY THROTTLE LEVER ADJUSTMENT: 1. Primary and secondary throttle valves must reach wide open position at the same time. To adjust, bend secondary operating rod. NOTE: Secondary throttle valves will be a few degrees from wide open when primary valves are wide open. 2. With primary and secondary throttle valves tightly closed, there should be .017 inch to .022 inch (Gauge T109-29) between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. To adjust, bend tang on secondary throttle lever.

NOTE: With carbureter level, auxiliary valves must close from wide open position of their own weight.

CARTER CARBURETOR
DIVISION OF ACF INDUSTRIES INCORPORATED
ST LOUIS, MO., U. S. A.

CARTER MODEL AFB CARBURETER FOR PONTIAC (SERVICE ADJUSTMENT PROCEDURE)

NOTE: The parts and specification pages referred to are catalog pages. These pages can be obtained from Carter Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the base of the carbureter, when requesting specification pages.

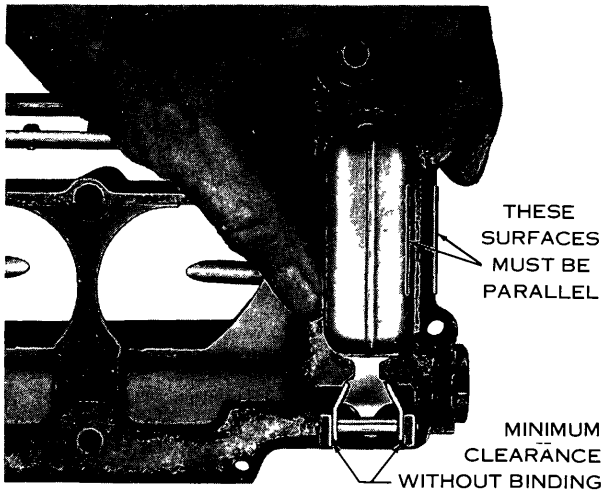

Figure 1

FLOAT ALIGNMENT ADJUSTMENT (Fig. 1):

1. Sight down the side of the float shell to determine if the side of the float is parallel to the outer edge of the air horn casting. TO ADJUST: Bend float lever by applying pressure to the end of the float shell with the fingers while supporting the float lever with the thumb.

   CAUTION: To avoid damaging the float, apply only enough pressure to bend float lever.

2. After aligning float, remove as much clearance as possible between arms of float lever and lugs on air horn by bending the float lever. Arms of float lever should be as parallel to the inner surfaces of lugs on air horn as possible.

   Floats must operate freely without excess clearance on its hinge pin.

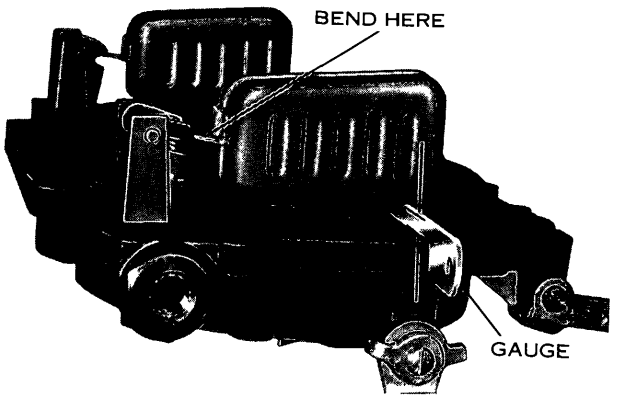

Figure 2

FLOAT LEVEL ADJUSTMENT (Fig. 2):

With air horn inverted, bowl cover gasket in place and needle seated, the clearance between top of float (at outer end) and air horn gasket should be as listed on carburetor specification page. To adjust, bend float arm. Adjust both floats. Recheck float alignment.

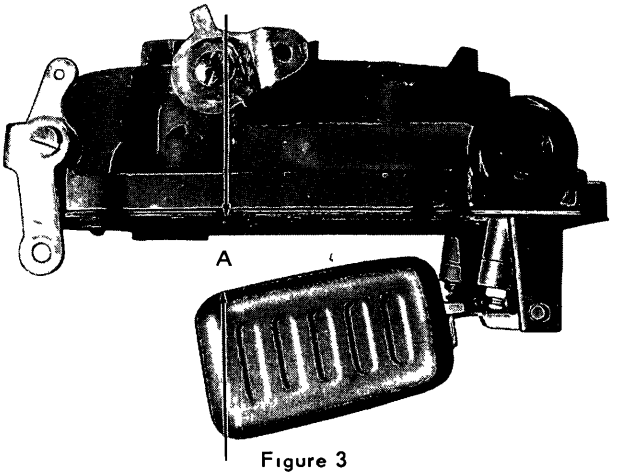

Figure 3

FLOAT DROP ADJUSTMENT (Fig. 3):

With bowl cover held in upright position and measuring from outer end of each float, the distance between top of floats and bowl cover gasket should be as listed on carbureter specification page. To adjust, bend stop tabs on float brackets.

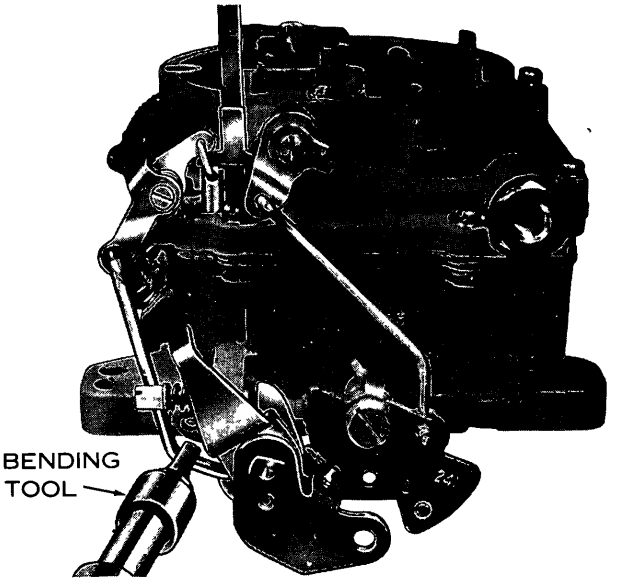

Figure 4

PUMP ADJUSTMENT (Fig. 4):

1. Back out idle speed screw until throttle valves seat in bores of carbureter. NOTE: Be sure choke is wide open so fast idle cam does not hold throttle valve open.
2. The distance from the top of the bowl cover to the top of the plunger shaft should be as listed on carburetor specification page.
3. Adjust by bending throttle connector rod at lower angle (use tool T109-213).

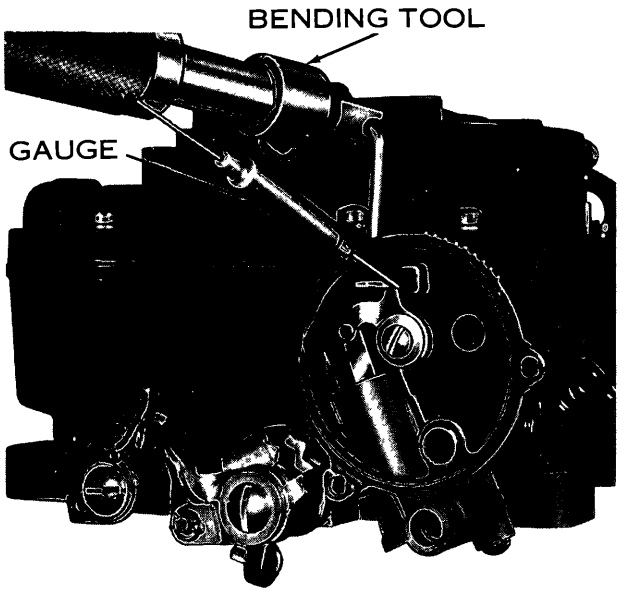

Figure 5

CHOKE PISTON LEVER ADJUSTMENT (Fig. 5):

With chok valv tightly closed, the clearance between chok lever and stop in piston housing should be as listed n carbur ter specification page. To adjust, bend chok conn ctor rod (use tool T109-213).

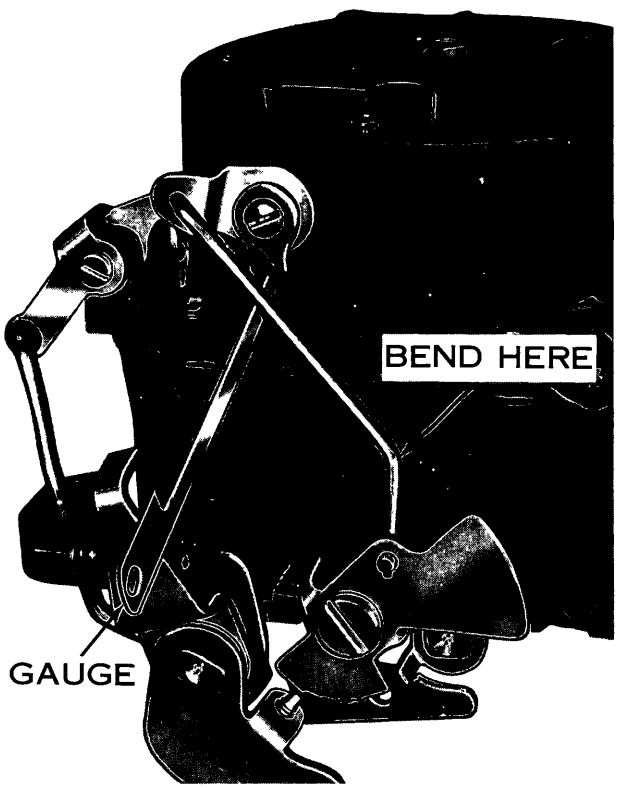

Figure 6

CHOKE SHAFT LEVER ADJUSTMENT (Fig. 6):

With choke valv tightly closed and fast idl cam against st p on casting, the clearanc b tw en lug on outer ch k shaft l ver and stop on inner chok shaft lever should b as listed on carbur ter specification pag . To adjust, b nd fast idl conn ctor r d (us t ol T109-213).

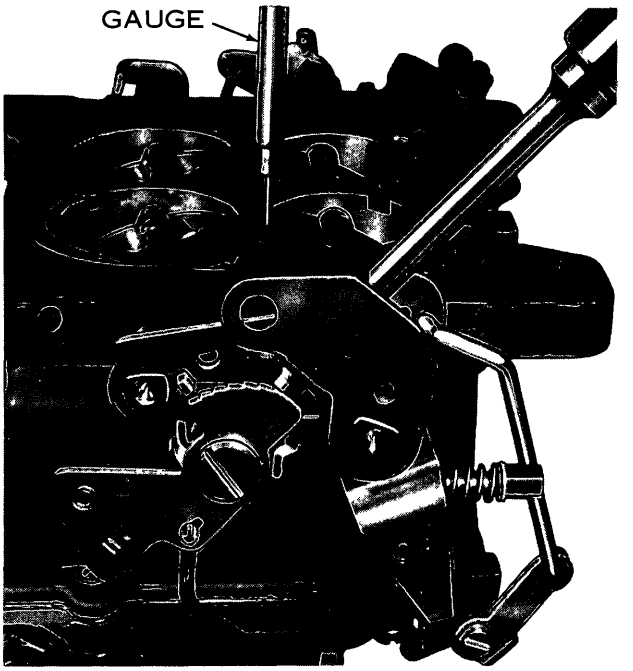

Figure 7

FAST IDLE THROTTLE VALVE CLEARANCE ADJUSTMENT (Fig. 7):

With choke valve tightly closed, tighten fast idle adjusting screw (on high step of cam) until the clearance between throttle valve and bore of carbureter, side opposite idle port, is as listed on carbureter specification page.

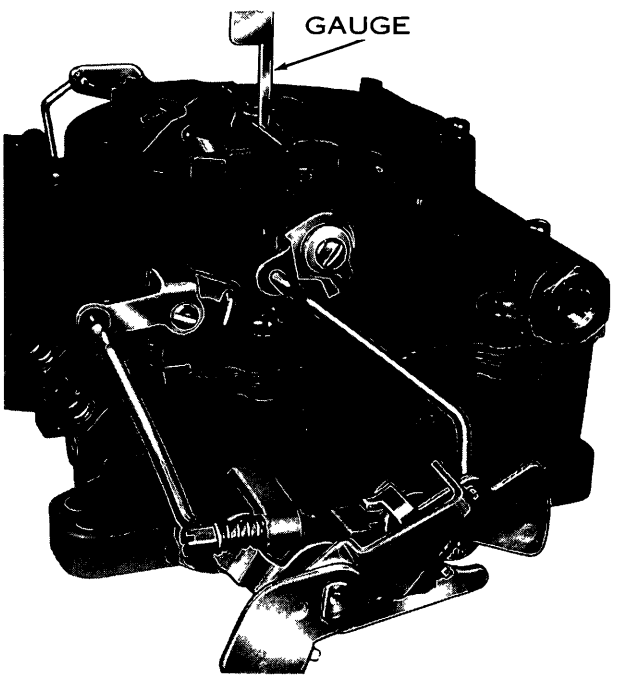

Figure 8

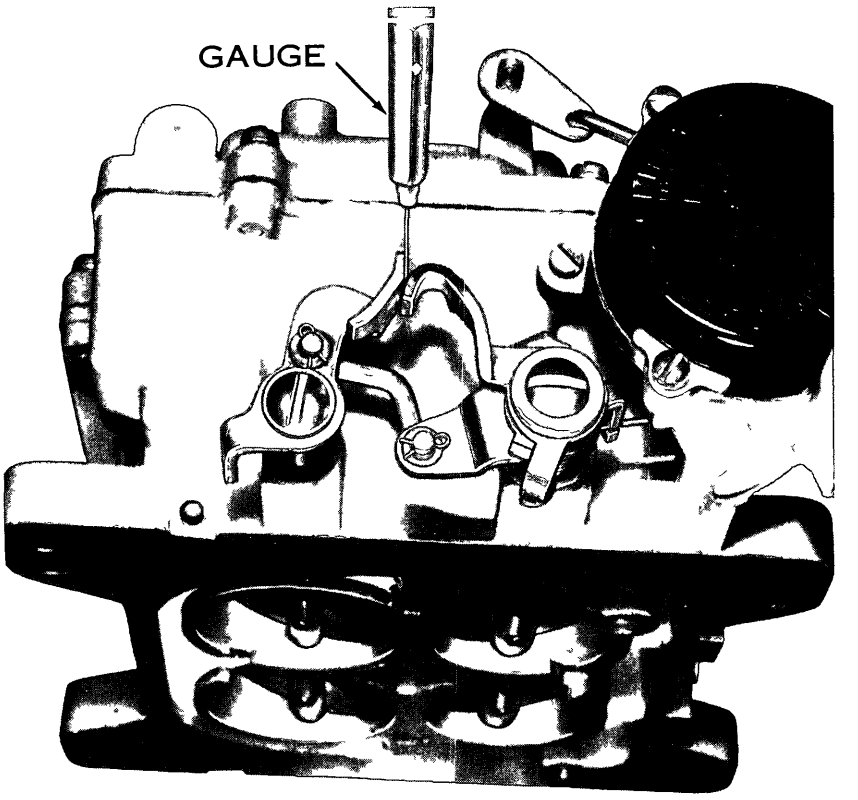
UNLOADER ADJUSTMENT (Fig. 8):

With throttle wide open, the clearance between upper edge of choke valve and inner wall of air horn should b as listed on carbureter specification page. To adjust, bend unloader lip on throttle shaft lever. (Use tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig. 9):

1. The stop lugs on both primary and secondary throttle levers should contact boss on flange at the same time. To adjust: bend secondary throttle operating rod at angle (use bending tool T109-213).
   NOTE: Secondary throttle valves will be a few degrees from vertical at wide open throttle.
2. With primary and secondary throttle valves in tightly closed position, the clearance between positive closing shoes on primary and secondary throttle levers should be as listed on carbureter specification page. To adjust, bend shoe on primary lever.



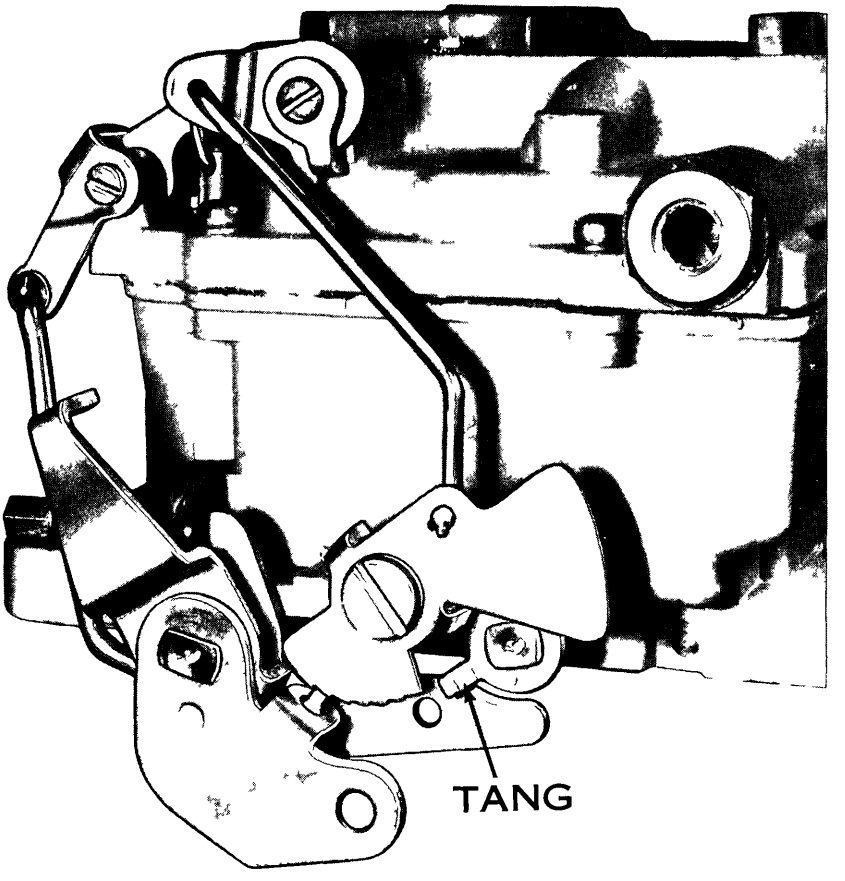


Figure 9

Figur 10

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 10):

Crack throttle valves and manually open and close th chok valv . Tang on secondary thr ttle lev r should freely engag in notch of lock-out dog. If nec ssary t adjust, bend tang on s c ndary thr ttl lever.

NOTE: See last pag for pertin nt service information.

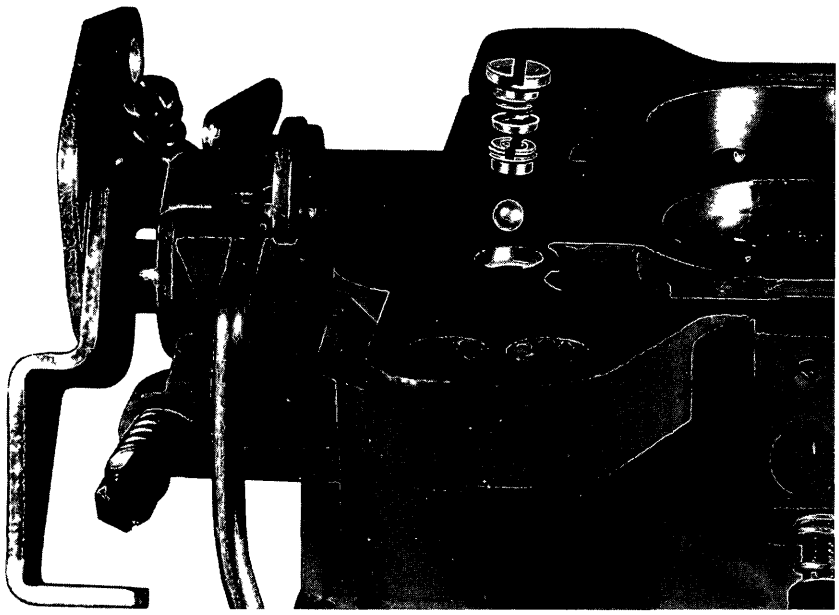

Figure 11

(Fig. 11):

Pump intake check ball, seat, washer and screw plug are removed by inverting carbureter and removing from lower side of flange.

(Fig. 12):

Ch ck to b sure that auxiliary throttle shaft weights move freely and ar fr e from dirt and gum (Fig. 12).

Flooding, stumbl on acceleration and other performance complaints are, in many instances, caused by the pr s nce of dirt, water or other foreign matter in the carbureter. To aid in diagnosing the cause of the complaint, th carbureter should be car fully r moved from the engine without draining the fuel from the b wl. The contents of the fuel bowl may th n b xamined for contamination as th carbureter is disassembled.

Ch ck th fuel in the bowl for contamination by dirt, water, gum or other for ign matter. A magnet moved through the fuel in the bowl will pick up and identify any iron oxide dust that may have caused intake needle and s at leakage.

Insp ct gasketed surfaces between body and air horn. Small nicks or burrs sh uld b smoothed down to liminate air r fuel leakage. Be especially particular when inspecting th top surfac of the inner wall of the bowl around the vacuum piston passag . A poor seal at this location may contribute to a "cutting-out" on turns complaint.

Install fuel baffles as shown (Fig. 12) to prev nt damage to floats.

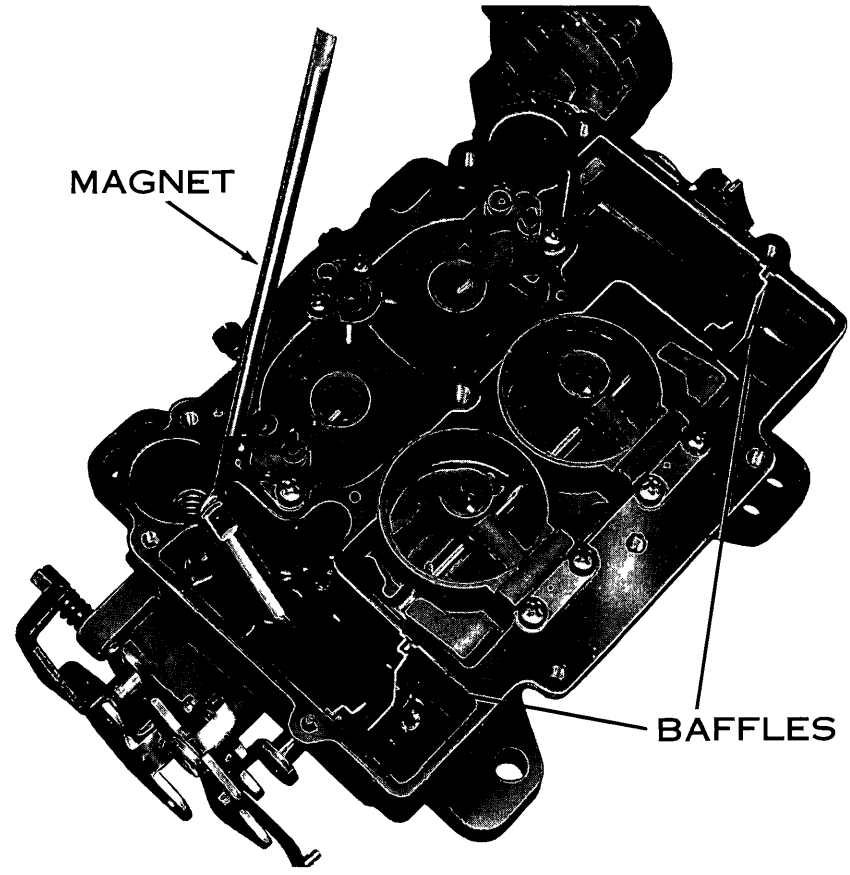

Figure 12

Fill th carbureter bowl with clean fuel befor installing on the manifold. This will help prevent dirt trapped in the fuel system from being dislodged by the fr flow of fuel as the carbureter is primed. The operation of the floats and intake needle and seats may be ch ck d und r pressure if a fu l pump is used at the bench to fill the carbur t r bowl. Op rat th throttl s v ral tim s and visually ch ck th discharg from th pump j ts.

B for installing th carbur t r, hold ch k valv op n and turn th idle spe d scr w until it just contacts th throttl lever, then 1/2 a turn more to open the throttle valves nough to k ep the engine running until th idl mixtur and final R.P.M. adjustment can be mad .

(Hydramatic Only)

WGD Dual Down-Draft Climatic® Control Carbureter No. 2359S

CARBURETER SPECIFICATIONS

For Pontiac 8 Cylinder Engine

Dimensions: Flange size 1¼ inch dual, 4 bolt type
Primary venturi 11/32 inch I. D
Secondary venturi, 21/32 inch I. D
Main venturi 1¼ inch I. D

Vents: Outside, in air horn

Gasoline Intake: Size No. 42 (.0935 inch) drill in needle seat

Low Speed Jet Tube: Jet size .031 inch diameter. By-pass, in air horn, size No. 60 (.040 inch) drill. Economizer, in air horn, size No. 63 (.037 inch) drill. Idle bleed in air horn size No. 54 (.055 inch) drill

Idle Port: Upper, slot type, length .195 inch, width .030 inch

Idle Port Opening: .144 to .150 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size No. 50 (.070 inch) drill

Set Idle Adjustment Screw: 1¼ to 2¼ turns open. For richer mixture turn screw out. Do not idle engine below 440 to 460 RPM Transmission—in Drive Range

Main Nozzle: Nozzle is installed permanently (DO NOT REMOVE) Anti-percolating well bleed in plug size No. 71 (.026 inch) drill. Bleed (between idle well and anti-percolator well) size No. 72 (.025 inch) drill

Metering Rod (Vacumeter Type): See parts list for size

Metering Rod Jet: Size .086 inch diameter

Accelerating Pump: Discharge jet (twin) size No. 74 (.0225 inch) drill. Intake check seat (in body) size .115 to .120 inch diameter also intake check ball in plunger shaft. Discharge (needle seat) size No. 50 (.070 inch) drill. Pump jet air bleed passage to outside 1/8 inch drill

Choke: Carter Climatic® Control—set on index. Butterfly type offset valve. Choke heat suction hole in air horn size No. 42 (.0935 inch) drill

Vacuum Spark Port: Round type .063 inch diameter. Top of port to be .050 to .060 inch above upper edge of valve with valve tightly closed.

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .033"-.038"	Breaker Point Setting .016"	Ignition Timing Breaker Points to Open: 5° B. U. D. C. At Vibration Damper	Float Setting 15/64 Inch (Use Gauge T109-32)	Idle Adjustment Screw Setting 1¼ to 2¼ Turns Open Idle Engine at 440 to 460 R. P. M. In Drive Range

NOTE: These cars are equipped with hydraulic valve lifters.—NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

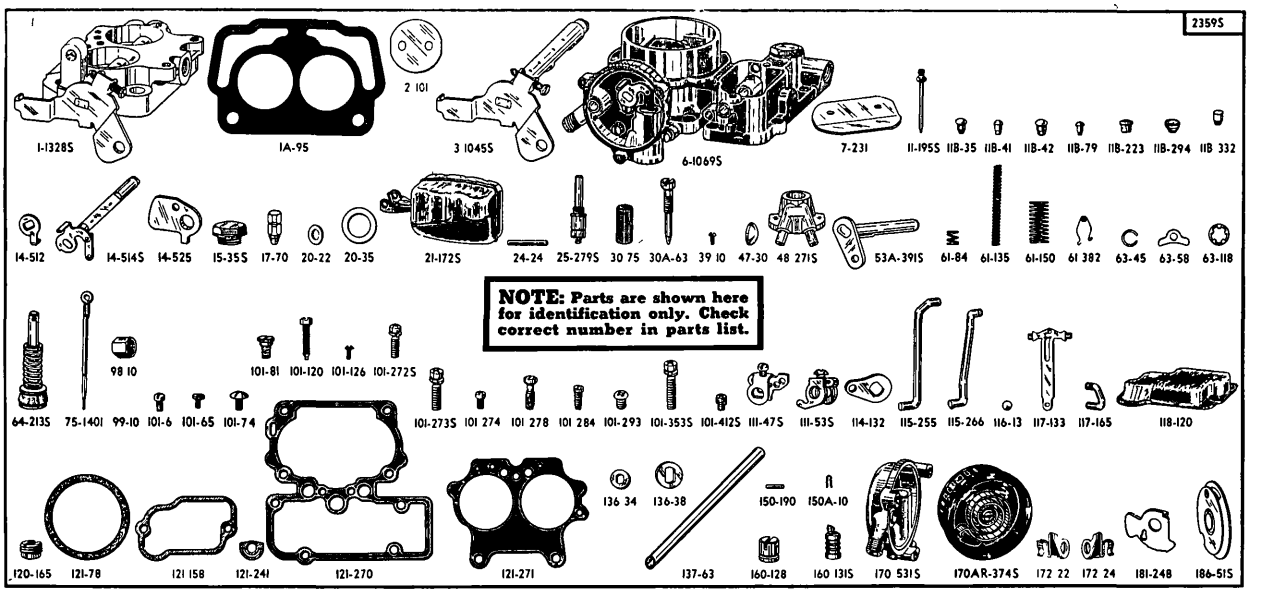
Float Level: 15/64" (Gauge T109-32) between top of float (at center) and bowl cover. To adjust, bend float lever

Float Alignment: Side of float parallel to edge of casting. Minimum clearance between lever and air horn lugs without binding. To adjust, bend float lever

Pump: With pump connector link in outer hole (long stroke) flat on pump arm should parallel straight edge on dust cover boss. To adjust bend throttle connector rod. (Use bending tool T109-213)

Metering Rod: Metering rod should bottom with throttle valves seated

Fast Idle Linkage Adjustment: With choke valve tightly closed and inner choke shaft lever in contact with outer choke shaft lever center of fast idle screw must align with index mark on fast idle cam. NOTE: There should be a slight clearance between tang on fast idle cam and stop on flange casting. To adjust, bend lug on outer choke shaft lever. (Use bending tool T109-214)



Fast Idle Throttle Valve Clearance: None

Unloader: 1/8" (Gauge T109-36) between top edge of valve and inner wall of air horn. To adjust, bend unloader arm on throttle lever. (Use bending tool T109-41)

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2364S-2364SA**

CARBURETER SPECIFICATIONS

For Pontiac 8 Cylinder Engine: 3.94 Inch Bore, 3.25 Inch Stroke

Dimensions: Flange size, 1¼ inch Four Bore 4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi size, 1-3/16 inch I. D.

Vents: Outside, (3). Inside, (6).

Gasoline Intake: Size No. 38 (.1015 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only) Jet size .036 inch diameter.
By-Pass plug, in body, size No. 53 (.0595 inch) drill.
Economizer, in low speed jet assembly, size .0492 inch diameter.
Idle bleed, in body, size No. 52 (.0635 inch) drill.

Idle Port: (Upper) slot type. Primary, length .195 inch; width .030 inch. Secondary, none.

Idle Port Opening: Primary, .139 to .145 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary, none.

Set Idle Adjustment Screw: 1¼ to 2¼ turns open. For richer mixture turn screw out. Do not idle engine below 450 to 470 R.P.M. (in neutral). For cars with air conditioning set idle at 510 to 530 R.P.M. with air conditioning off.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet (primary, in plug) size No. 60 (.040 inch) drill, (secondary, in body) size No. 60 (.040 inch) drill.

Metering Rod: Primary, economy step .0734 inch diameter. Middle step tapers to .049 inch diameter. Power step .042 inch diameter. Secondary, none.

Metering Rod Jet: Primary, size .0995 inch diameter (for metering rod). Secondary, size .070 inch diameter. (No metering rod.)

Accelerating Pump: Discharge jet (twin) primary side only, size No. 72 (.025 inch) drill.

Intake ball check seat, size .115 to .120 inch diameter.

Discharge needle seat, size .070 inch diameter.

Discharge relief check, size No. 55 (.052 inch) drill.

Choke: Carter Climatic® Control, set one point rich. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 40 (.098 inch) drill.

Vacuum Spark Port: .062-.064 inch diameter. Top of port .029 to .039 inch above valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: **Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.**

Spark Plug Gap .033"-.038"	Breaker Point Setting .016"	Ignition Timing Breaker Points to Open: 5° B. U. D. C. At Vibration Damper	Float Setting See Adjustments	Idle Adjustment Screw Setting 1¼ to 2¼ Turns Open Idle Engine at 450 to 470 R.P.M. In Neutral

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical

LATERAL ADJUSTMENT With bowl cover assembly inverted bowl cover gasket removed and float resting on seated needle place float gauge (T109 222) directly under floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats

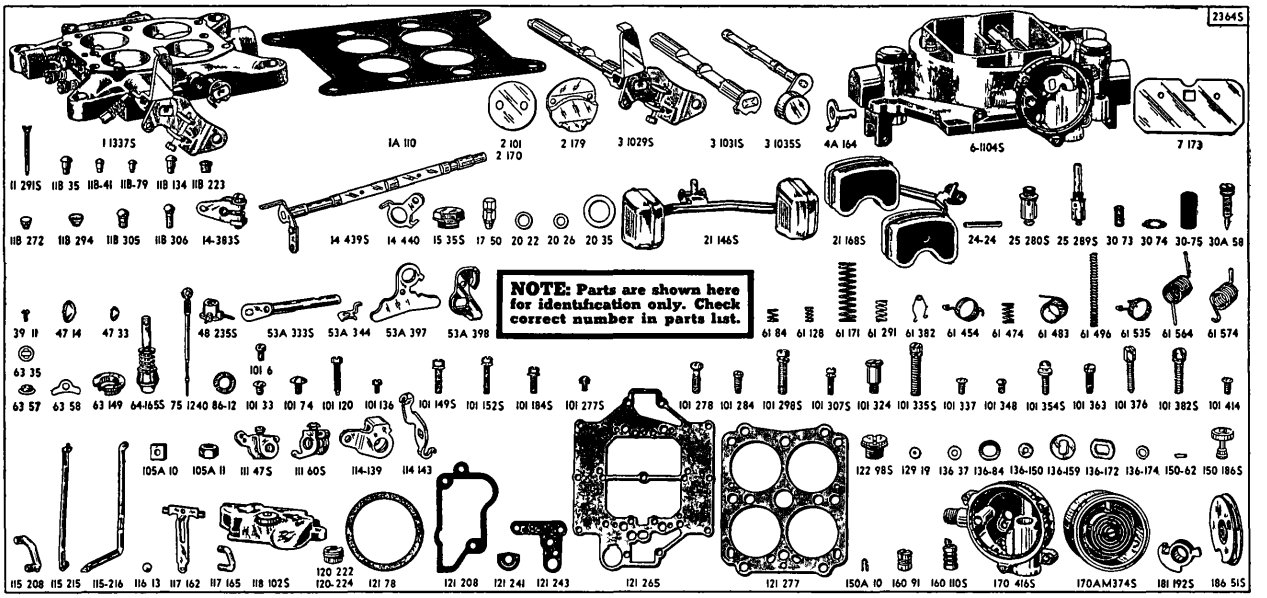
VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting must be 3/16 inch for both primary and secondary floats (gauge T109 222) Adjust by bending float arms

FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of float the distance between top of floats and bowl cover should be 11/16 inch for both primary and secondary floats Adjust by bending stop tabs on float brackets

PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109 213)

METERING ROD ADJUSTMENT Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

BOWL VAPOR VENT ADJUSTMENT This adjustment should be made after completing pump and metering rod adjustments Install dust cover and dust cover gasket Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter There should be 1/16 inch (gauge T109 197) between lower edge of bowl vapor vent valve and dust cover To adjust remove dust cover and bend vapor vent arm



FAST IDLE ADJUSTMENT (a) Loosen choke lever clamp screw on choke shaft Insert 020 inch feeler gauge T109 29 between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed tighten fast idle adjusting screw until there is 030 inch (gauge T109 29) opening between throttle valve and bore of carbureter side opposite idle port Be sure fast idle adjusting screw is on high step of cam while making this adjustment

UNLOADER ADJUSTMENT With throttle wide open there should be 1/8 inch (gauge T109 36) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

SECONDARY THROTTLE LEVER ADJUSTMENT Primary and secondary throttle valves should reach wide open position at the same time To adjust bend throttle operating rod at upper angle (Use bending tool T109 213) With primary and secondary valves in tightly closed position there should be 017 022 inch (gauge T109 29) clearance between positive closing shoes on primary and secondary throttle levers To adjust bend shoe on primary lever

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT This adjustment should be made after completing fast idle and secondary throttle lever adjustments Crack throttle valves and manually open and close the choke valve Tang on secondary throttle lever should freely engage in notch of lock out dog If necessary to adjust bend tang on secondary throttle lever

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2268S-2283S**

CARBURETER SPECIFICATIONS

For Pontiac 8 Cylinder Engine: 3.75 Inch Bore, 3.25 Inch Stroke

Dimensions: Flange size, 1 1/8 inch Four Bore 4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 1-1/16 inch I. D.
Main venturi (secondary) size, (2268S) 1 inch (2283S) 15/16 inch I. D.

Float Level: See adjustments.

Vents: Outside, (5) in bowl cover, (2) in dust cover. Inside, (3) on primary side, (3) on secondary side.

Gasoline Intake: Size No. 38 (.1015 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only) Jet size (2268S) No. 68 (.031 inch) (2283S) No. 67 (.032 inch) drill.
By Pass, in body, size No. 53 (.0595 inch) drill.
Economizer, in low speed jet assembly, size .0492 inch diameter.
Idle bleed, in body, size No. 52 (.0635 inch) drill.

Idle Port: (Upper) slot type. Primary, length .195 inch; width .030 inch. Secondary, none.

Idle Port Opening: Primary, .139 to .145 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary, none.

Set Idle Adjustment Screw: 3/4 to 1 3/4 turns open. For richer mixture turn screw out. Do not idle engine below 390 r.p.m. For (Hydramatic—in drive range), or 450 r.p.m. For (Syncromesh Trans.)

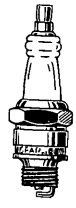
Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet (primary, in plug) size No. 60 (.040 inch) drill, (secondary, in body) size (2268S) No. 60 (.040 inch), (2283S) No. 56 (.0465 inch) drill.

Metering Rod: Primary, economy step (2268S) .0745 inch, (2283S) .072 inch diameter. Middle step tapers to (2268S) .068 inch, (2283S) .069 inch diameter. Power step, .059 inch diameter. Secondary, none.

Metering Rod Jet: Primary, size .0935 inch diameter (for metering rod). Secondary, size (2268S) .0492 inch, (2283S) .0512 inch diameter. (No metering rod.)

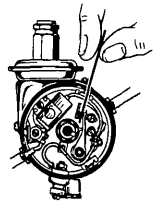
Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 72 (.025 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.



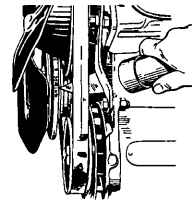
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set on index. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 45 (.082 inch) drill.

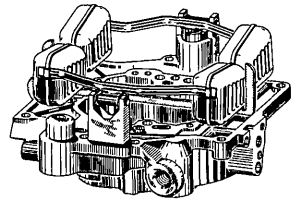


Vacuum Spark Port: .062-.064 inch diameter. Top of port .029 to .039 inch above valve with valve tightly closed.

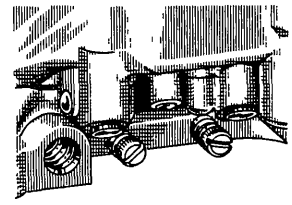
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carburet r.



Spark Plug Gap .033"-.038"



Breaker Point Setting .016"

Ignition Timing Breaker Points to Open: 5° B.T.D.C.

Float Setting See Adjustments

Idle Adjustment Screw Setting 3/4 to 1 3/4 Turns Open

NOTE: These cars equipped with Hydraulic Valve Lifters. NO ADJUSTMENT.

CARBURETER ADJUSTMENTS

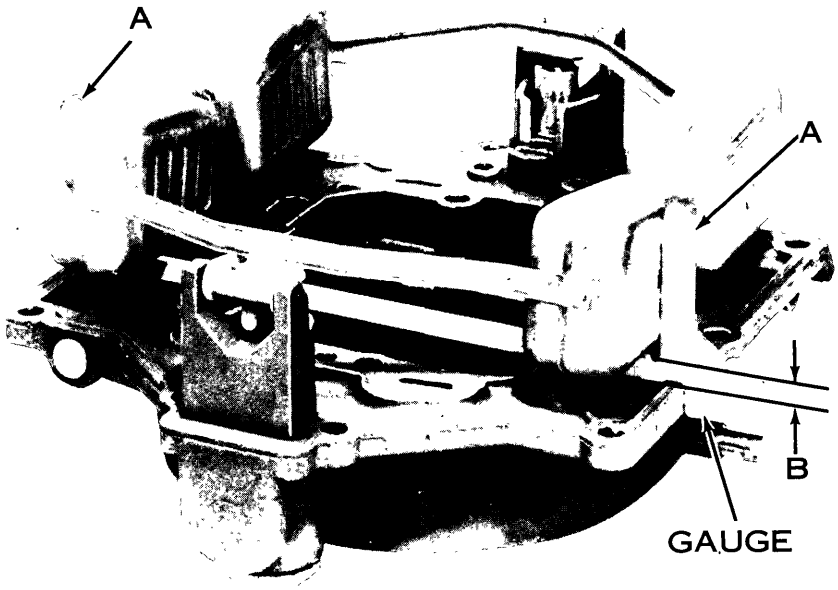

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

Two separate float adjustments must be made—lateral and vertical.

LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge (T109-222) directly under floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge (A). Adjustment should be made by bending arms of floats.

VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance (B) between top of float and machined surface of casting must be 3/16 inch for both primary and secondary floats (gauge T109-222). Adjust by bending float arms.

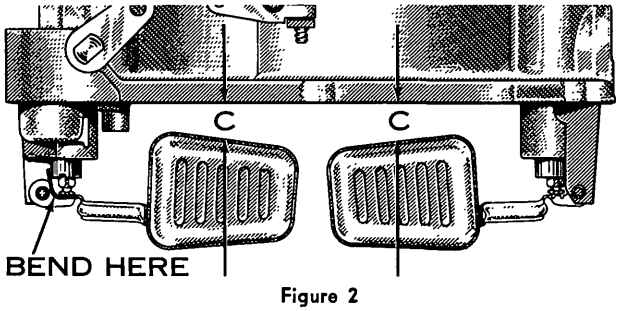

Figure 2
Float Drop Adjustment

FLOAT DROP ADJUSTMENT (Fig. 2):

With bowl cover held in upright position and measuring from center of float, the distance between top of floats (C) and bowl cover should be 11/16 inch for both primary and secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT (Fig. 3):

Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw (D) until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

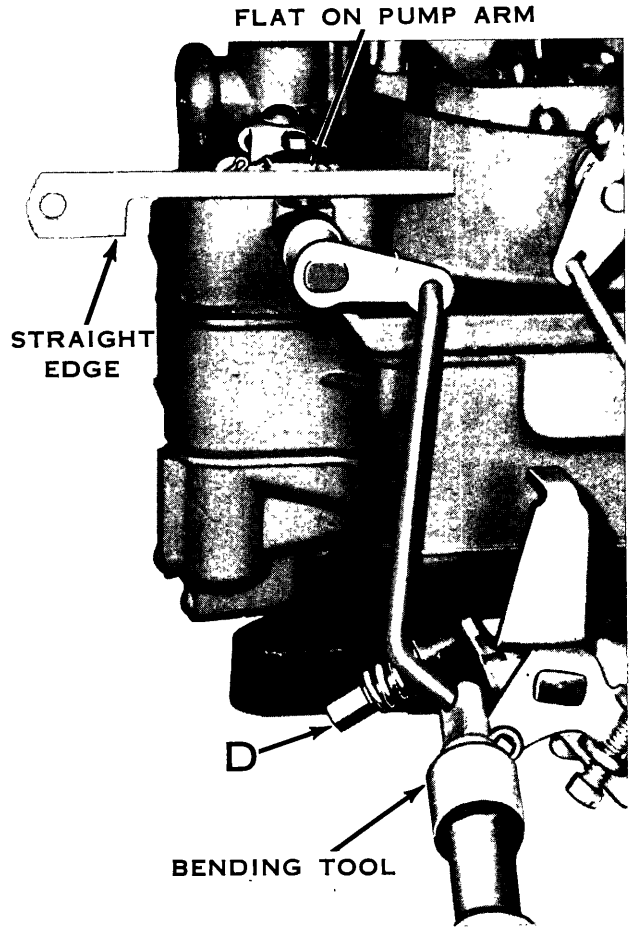

Figure 3
Pump Adjustment

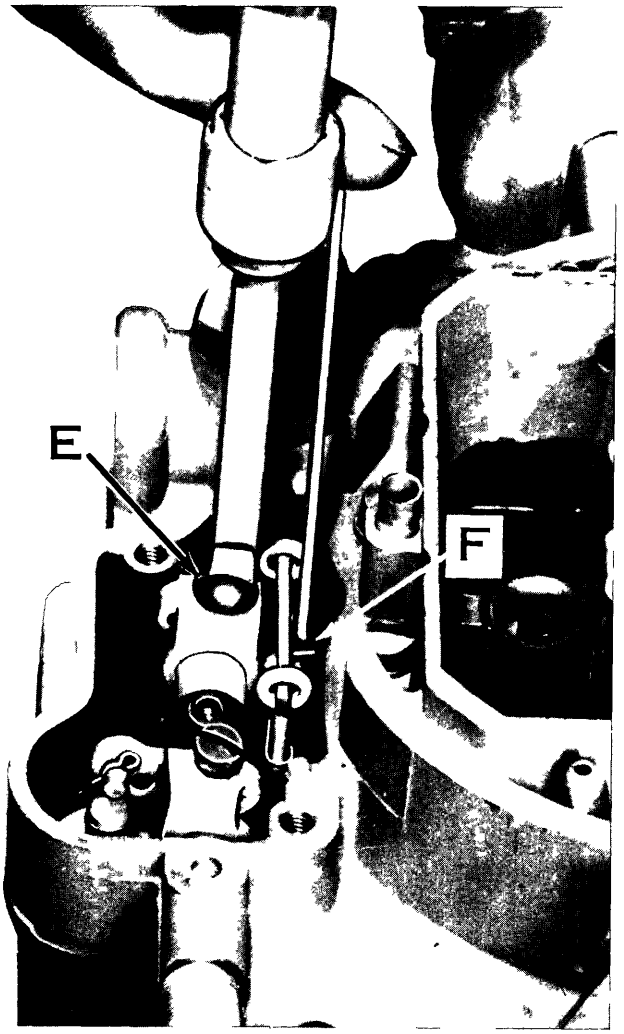

Figure 4
Metering Rod Adjustment

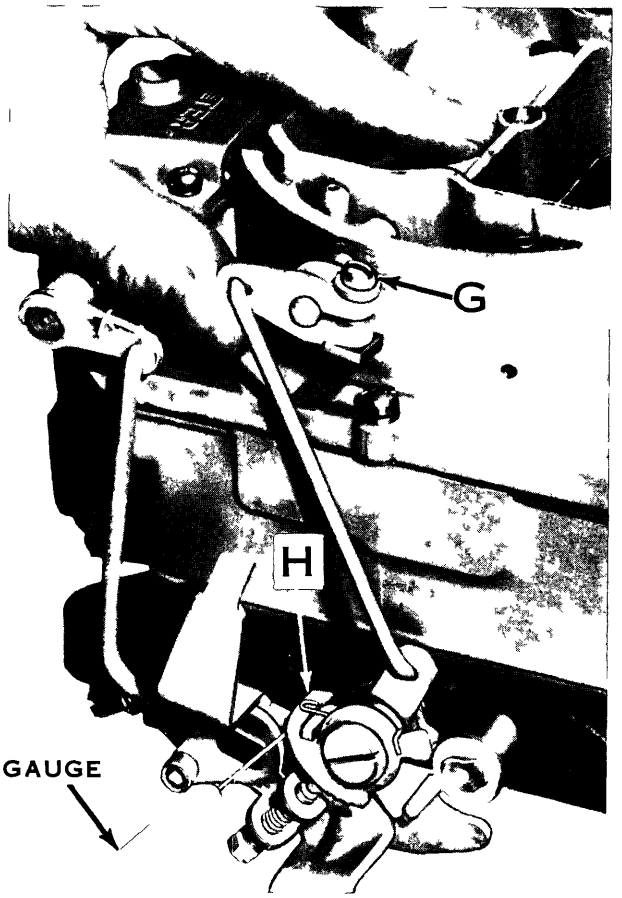

Figure 5A
Fast Idle Adjustment

METERING ROD ADJUSTMENT (Fig 4)

Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (E) 2 With metering rods in place press down on vacumeter link until metering rods bottom in carbureter body casting 3 Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link (F) Hold in place and care fully tighten clamp screw (E)

FAST IDLE ADJUSTMENT (Fig 5A and 5B)

(a) Loosen choke lever clamp screw (G) on choke shaft In sert 020 inch feeler gauge T109 29 between lip of fast idle cam and boss of flange casting (H) Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (G) (b) With choke valve tightly closed tighten fast idle adjusting screw (J) until there is 018 inch (gauge T109 44) opening between throttle valve and bore of car bureter side opposite idle port Be sure fast idle adjusting screw (J) is on high step of cam while making this adjustment

NOTE **Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used.**

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

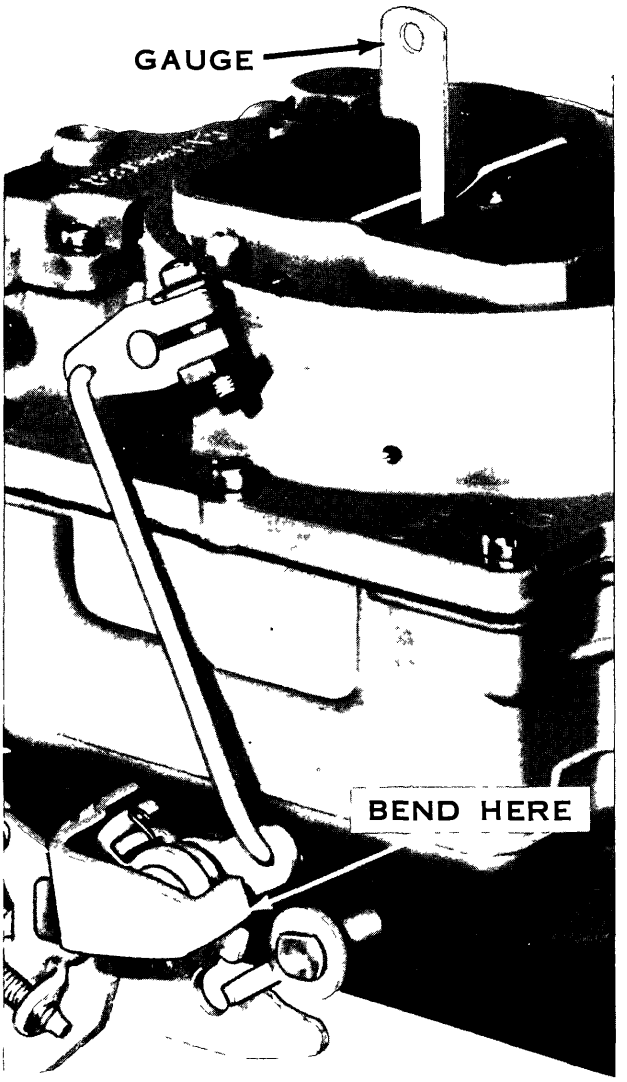

Figure 6
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 6):
With throttle wide open there should be 1/8 inch (gauge T109-36) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

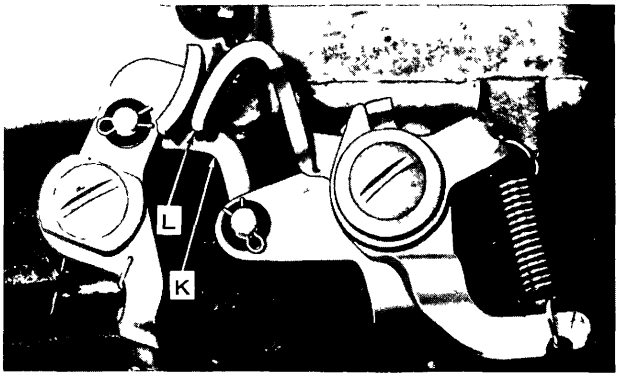

Figure 7
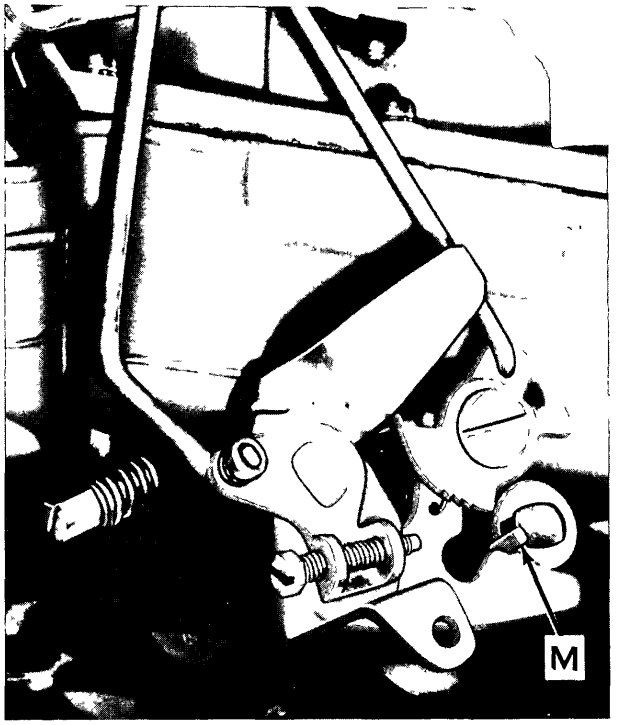
Secondary Throttle Lever Adjustment

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig. 7):
Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle (K). (Use bending tool T109-213.) With primary and secondary valves in tightly closed position there should be .017-.022 inch (gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust bend shoe (L) on primary lever.



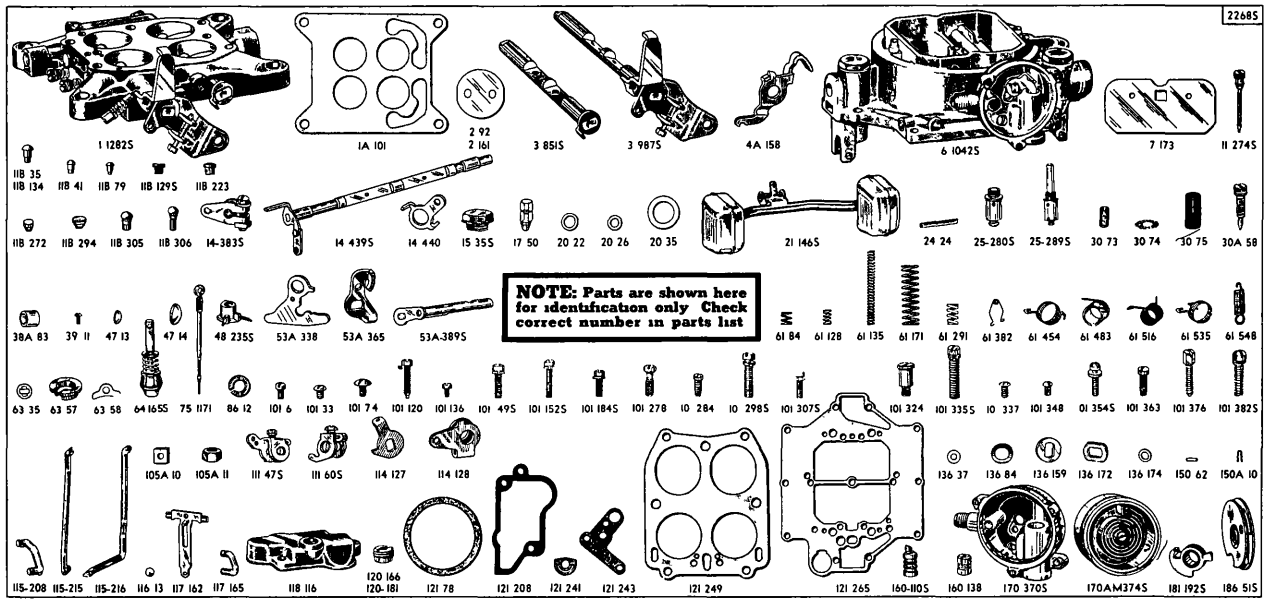


Figure 8
Secondary Throttle Lock-Out Adjustment

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 8):
This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and manually open and close the choke valve. Tang (M) on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang (M) on secondary throttle lever.

CARBURETER ADJUSTMENTS

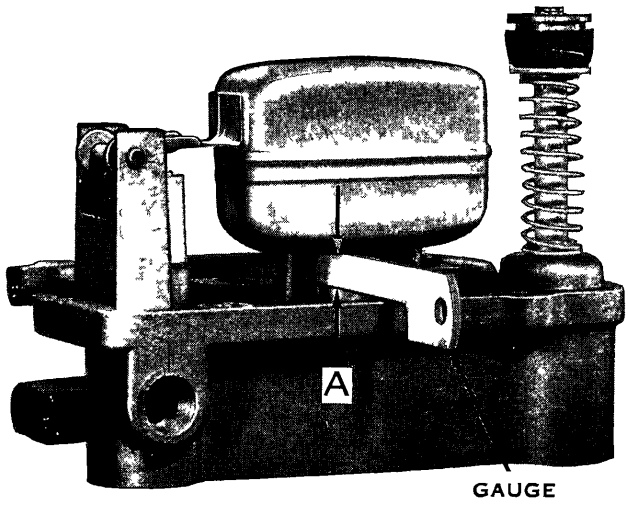

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

With bowl cover gasket removed, bowl cover inverted and needle seated there should be 7/32 inch (A) (gauge T109-106) between top of float and bowl cover Adjust by bending float arm

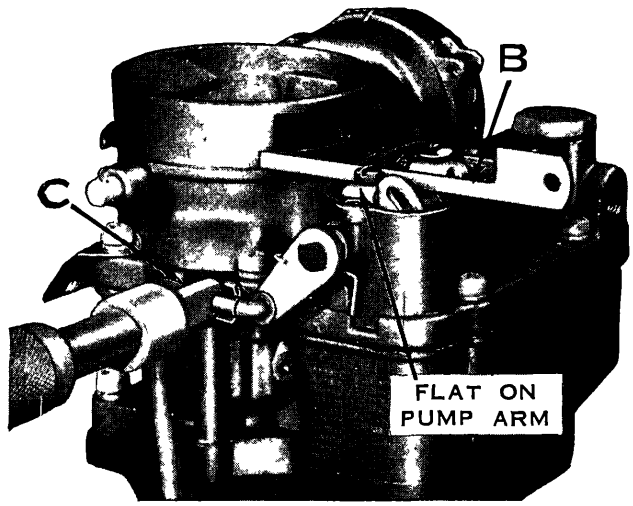

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig. 2):

Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge (B) across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending pump arm at upper angle (C) Use bending tool T109-213

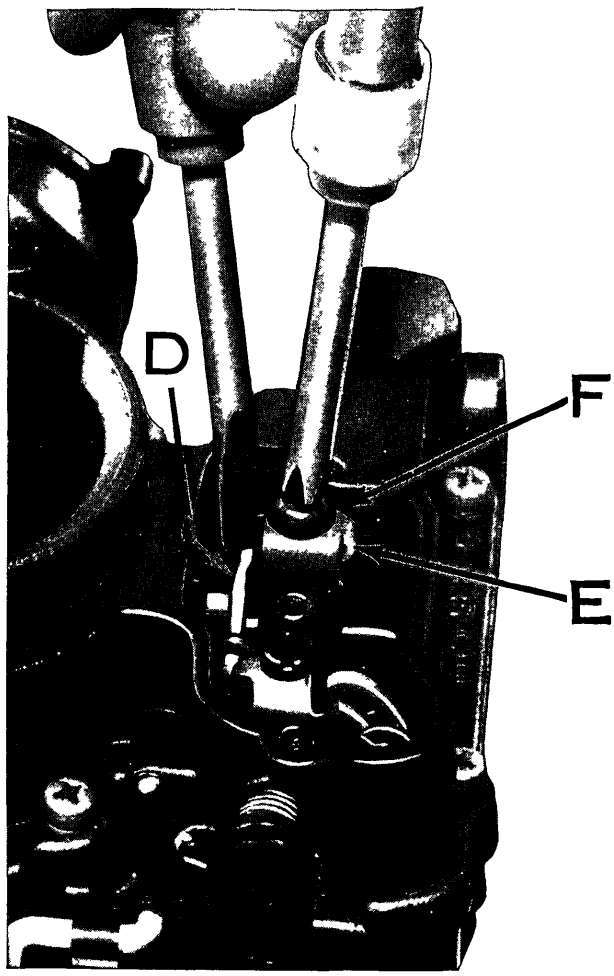

Figure 3
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 3):

The metering rods must be adjusted after the pump adjustment No metering rod gauges are necessary, procedure is as follows With the throttle lever set screw backed out and throttle valves seated in bores of carbureter press down on vacumeter link (D) until metering rods bottom in casting With rods held in this position, revolve metering rod arm (E) until lip contacts vacumeter link Hold in place and carefully tighten metering rod arm set screw (F)

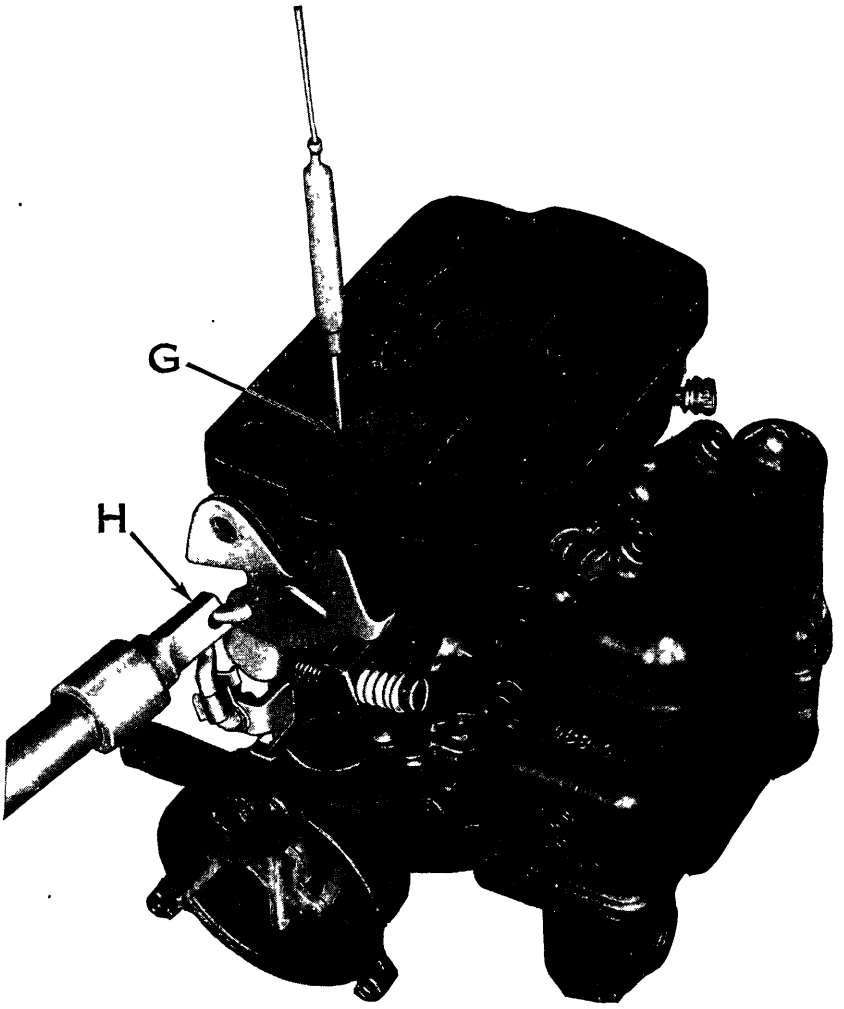

Figure 4
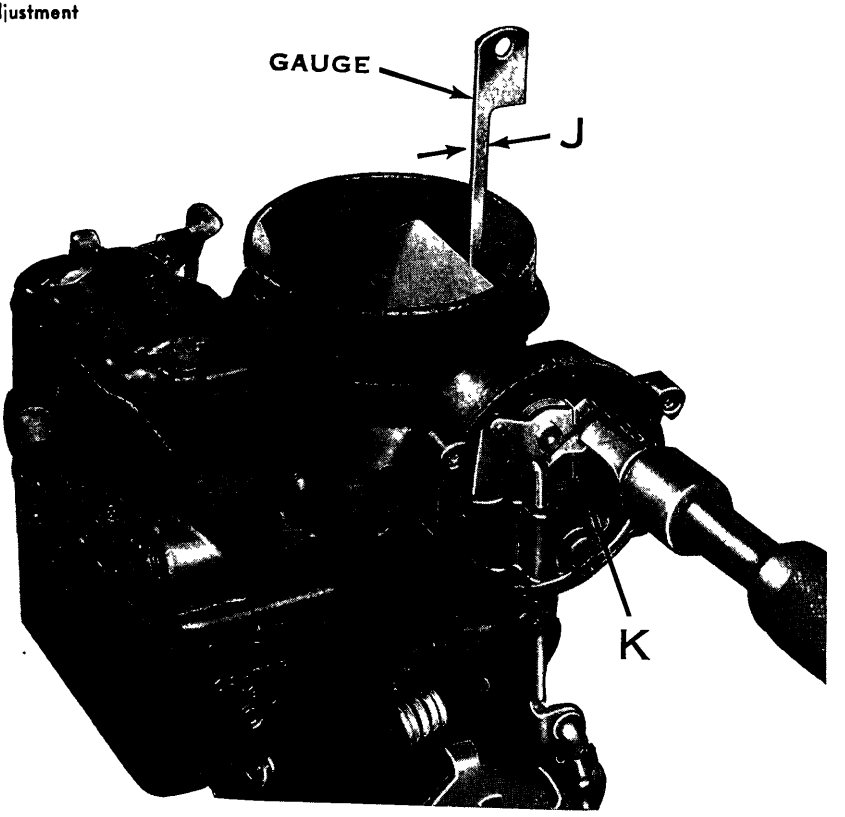
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 4):

With the thermostatic coil housing gasket and baffle plate removed, crack throttle valve and hold choke valve closed. Then close throttle. There should now be .026 inch clearance (G) (gauge T109-189) between throttle valve and bore of carbureter (side opposite idle port). Adjust by bending the choke connector rod at lower angle (H).



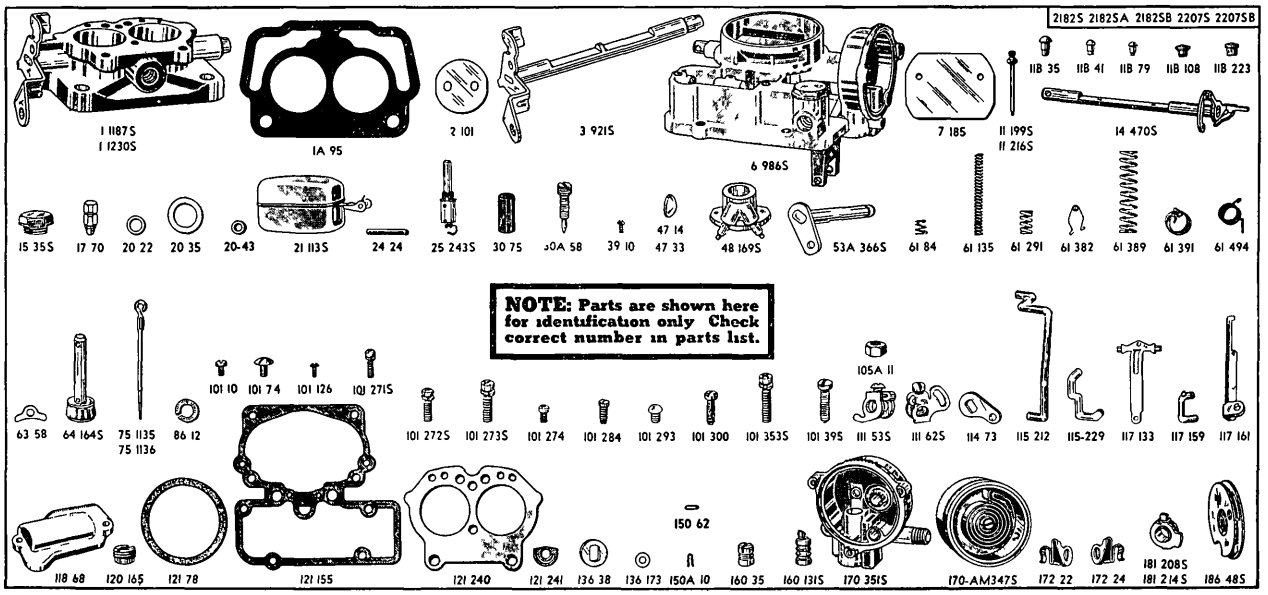


Figure 5
Unl ader Adjustment

UNLOADER ADJUSTMENT (Fig. 5):

This adjustment must be made after fast idle adjustment. Hold throttle valve in wide open position and close choke valve as far as possible without forcing. There should be 5/32 inch (gauge T109-154) clearance (J) between upper edge of choke valve and inner wall of air horn. Adjust by bending choke shaft unloader arm (K) (Use bending tool T109-213).

GENERAL BULLETIN

ALL CARBURETER ACCCUNTS

BULLETIN NO. 16 - PONTIAC

DATE September 4, 1957

SUBJECT: 1955 PONTIAC V8 REPLACEMENT CARBURETER WGD-2182SBU

When replacing an equipment carbureter (dual) of a make other than Carter on a 1955 Pontiac, a longer choke heat tube and fittings are required. To make this installation easier, all of the material needed is combined in a "U" type package. The number will be WGD-2182SBU.

WGD-2182SBU Package consists of:

1 - WGD-2182SB carbureter

1 - 98-10 compression nut

1 - 99-10 compression cone

1 - 137-64 heat tube

1 - 188-88 heat tube cover (asbestos loom)

The WGD-2182SB will also be available (without these extra parts) for replacement on cars factory-equipped with Carter carbureters.

CARBURETER ADJUSTMENTS

Float Adjustment Two separate float adjustments must be made—lateral and vertical **Lateral Adjustment** With bowl cover assembly inverted bowl cover gasket removed and float lip resting on seated needle, place float gauge T109 162 directly under float with notched portions of gauge fitted over edges of casting Sides of floats should barely touch the vertical uprights of float gauge Adjustment should be made by bending arms of floats **Vertical Adjustment** With float gauge in same position floats should just clear the horizontal portion of gauge (Vertical distance between top of float and machined surface of casting must be 3/16 inch) Adjust by bending float arms Remove float install bowl cover gasket and then reinstall float

Pump Adjustment The total distance the plunger head (not shaft) moves from closed to wide open throttle position controls the amount of fuel discharged Correct pump plunger travel is important and should be checked each time the carbureter is disassembled or when leaner than standard metering rods are installed Procedure is as follows

Install pump connector link in lower hole (short stroke) of pump arm with ends extending towards countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Be sure fast idle adjusting screw does not hold throttle open Place universal pump travel gauge T109-117S inverted on edge of dust cover boss of bowl cover Turn knurled nut of gauge until finger just

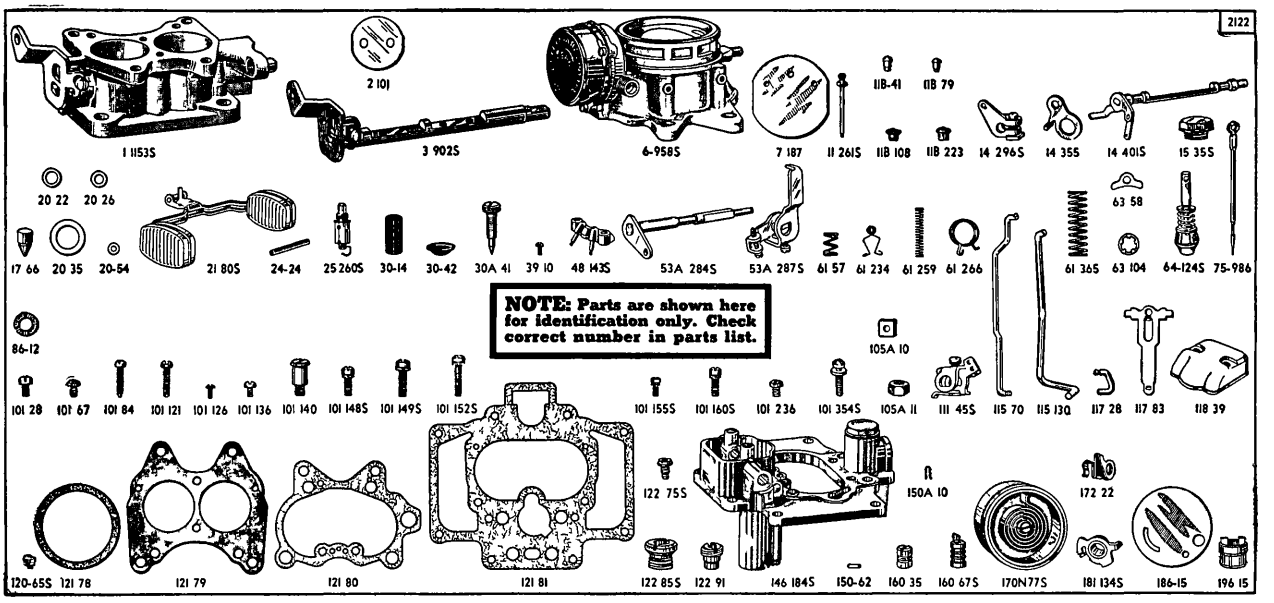
CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

touches upper end of plunger shaft Number indicated on gauge should be "32" Hold the gauge vertical to insure correct reading

Adjust by bending the throttle connector rod at lower angle

Optional Adjustment With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 20/64"



Adjust as mentioned above

Metering Rod Adjustment With throttle valves seated in bores of carbureter, insert one metering rod gauge T109-163 in place of either metering rod Press down lightly on vacuum piston link until lug of piston link contacts lip of metering rod arm There should be less than 005" clearance between metering rod bearing and shoulder in notch of gauge Adjust by bending lip of metering rod arm (Tool T109-105)

Fast Idle Adjustment: Loosen choke lever clamp screw on choke shaft Insert 040 inch feeler gauge T109-193 between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw

With choke valve tightly closed, tighten fast idle adjusting screw until there is 026 inch (gauge T109-189) opening between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment

Unloader Adjustment: With throttle wide open there should be ⅛ inch (gauge T109-36) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever Use bending tool (T109-41)

Pontiac 8—1954—Carbureter No. 2122S

PONTIAC SIX MODELS "53-25" "54-25" 1953-1954

WCD Dual Down-Draft Climatic® Control **Carbureter No. 2010S**

CARBURETER SPECIFICATIONS

For Pontiac 6 Cylinder Engine: 3-9/16 Inch Bore, 4 Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 19/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: See adjustments.

Vents: Inside, none. Outside, two No. 35 (.110 inch) drill in air horn.

Gasoline Intake: Size No. 42 (.0935 inch) drill in needle seat.

Low Speed Jet Tube: Jet size No. 66 (.033 inch) drill. By-pass, size No. 56 (.0465 inch) drill. Economizer, size No. 63 (.037 inch) drill. Idle bleed, size No. 55 (.052 inch) drill.

Idle Port: Upper, slot type, length .165 inch; width, .030 inch.

Idle Port Opening: .122 to .128 inch above upper edge of valve with valve tightly closed.

Lower Port: (Early prod.) (For idle adjustment screw) 2—Size .0615 to .0655 inch diameter. (Late prod.) Size .0615 to .0655 inch diameter (For idle adjustment screw). Size .050-.054 inch diameter (port without idle adjustment screw).

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out Idle engine between 520-540 r p m (Syncro-mesh), 365-385 r p m. (Hydra-matic) and 410-430 r p m (Power Glide) (All in neutral).

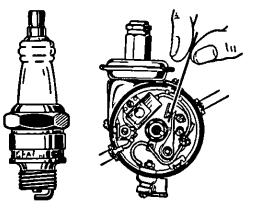
Main Nozzle: Nozzle is installed permanently. Do not remove.

Metering Rod (Vacumeter Type): Economy step .0625 inch diameter. Middle steps tapers to .0535 inch diameter. Power step .050 inch diameter. These rods designed with stabilizing flats on economy step.

Metering Rod Jet: .082 inch diameter.

Metering Rod Setting: See adjustments.

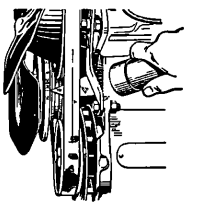
Accelerating Pump: Discharge jet (twin), size No. 74 (.0225 inch) drill. Intake ball check, in plunger shaft. Discharge needle seat, size No. 50 (.070 inch) drill.



Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set 2 notches lean Butterfly type, off-set valve. Air bleed in choke valve, size .156 inch diameter Choke heat suction hole in bowl cover, size No. 30 (.1285 inch) drill.

Vacuum Spark Port: 062 to 064 inch diameter. Top of port to be 052 to 056 inch above valve with valve tightly closed.



Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

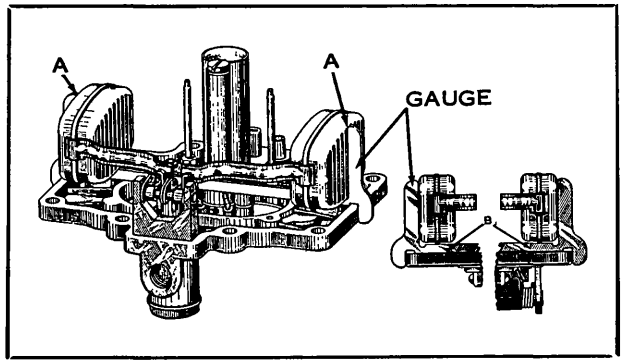

Figure 1

FLOAT ADJUSTMENT (Fig. 1):

Two separate float adjustments must be made—lateral and vertical.

Lateral Adjustment: With bowl cover assembly inverted, bowl cover gasket removed, place float gauge (T109-196) directly under floats with notched portions of gauge fitted over edges of casting. Sides of floats should barely touch the vertical uprights of float gauge (A). Adjustment should be made by bending arms of floats.

Vertical Adjustment: With float gauge in same position floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 5/32 inch (B). Adjust by bending float arms. Remove floats. install bowl cover gasket and then re-install floats.

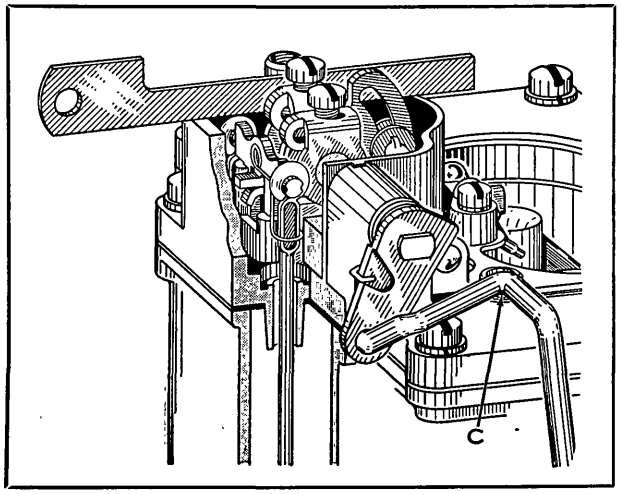

Figure 2

PUMP ADJUSTMENT (Fig. 2):

Back out throttle lever set screw until throttle valves seat in bores of carbureter. Be sure fast idle adjusting screw does not hold throttle open. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at upper angle (C). Use tool T109-213.

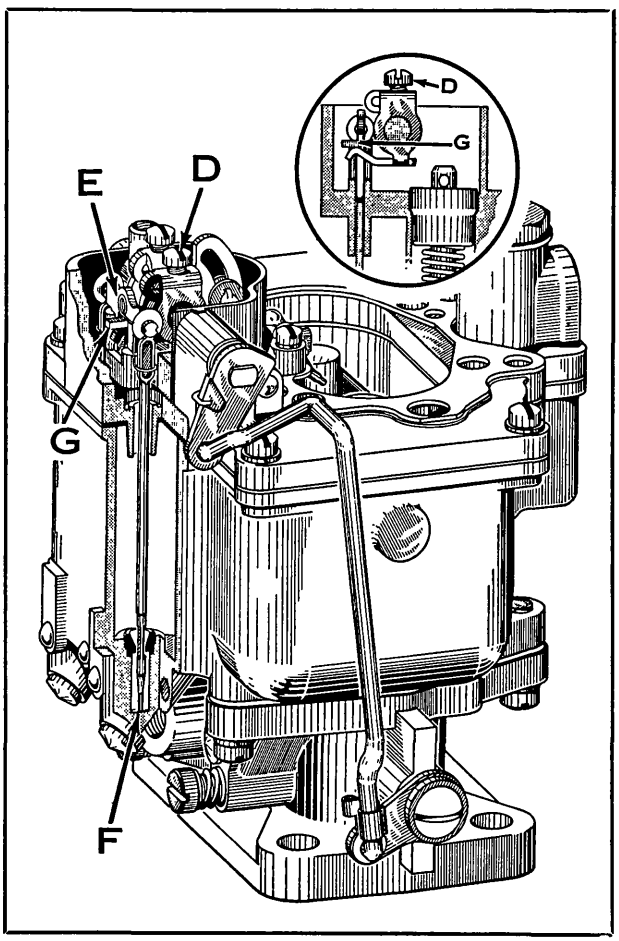

Figure 3

METERING ROD ADJUSTMENT (Fig. 3):

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows:

1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (D).
2. With metering rods in place, press down on vacumeter link (E) until metering rods bottom in carbureter body casting (F).
3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link (G). Hold in place and carefully tighten clamp screw (D).

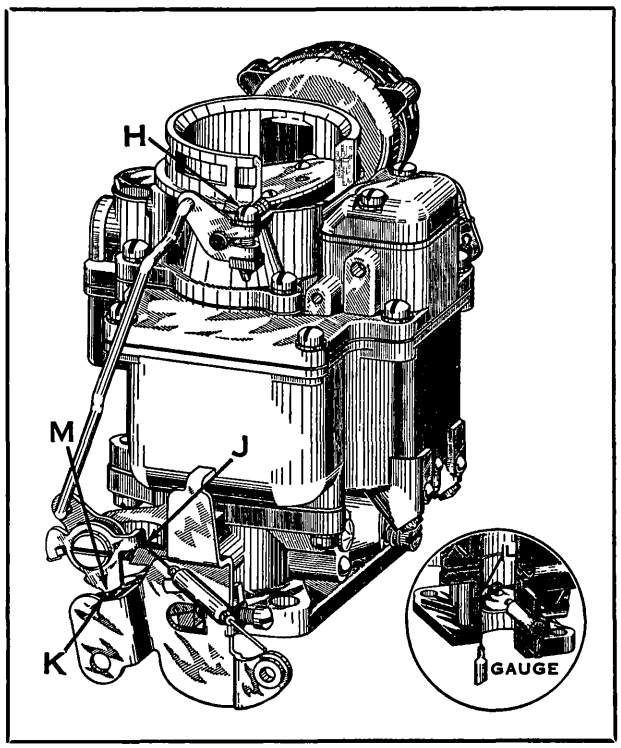

Figure 4

FAST IDLE ADJUSTMENT (Fig. 4):

Loosen choke lever clamp screw (H) on choke shaft. Insert .040 inch feeler gauge (T109-193) between lip of fast idle cam and boss of flange casting (J). Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (H).

With choke valve tightly closed, tighten fast idle adjusting screw (K) until there is .026 inch (Gauge T109-189) opening between throttle valve and bore of carbureter (side opposite idle port) (L). Be sure fast idle adjusting screw is on high step of cam (M) while making this adjustment.

UNLOADER ADJUSTMENT (Fig. 5):

With throttle wide open there should be 9/64 inch (Gauge T109-34) clearance (N) between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip (O) on throttle shaft lever (use bending tool T109-41).

CARBURETER SPECIFICATIONS

(1949-50) For Pontiac 8 Cylinder Engine: 3 1/4 Inch Bore, 3 3/4 Inch Stroke
(1951-54) For Pontiac 8 Cylinder Engine: 3 3/8 Inch Bore, 3 3/4 Inch Stroke

Dimensions: Flange size, 1 1/4 inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 19/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: Distance from seam of float (both sides—at top center) to lower edge of bowl cover, when needle is seated to be 3/16 inch. (Use gauge No. T109-162.)

Vents: Inside, none. Outside, No. 35 (.110) drill—2 holes.

Gasoline Intake: Square vertical push pull needle. Size No. 42 drill in needle seat.

Low Speed Jet Tube: Jet size, No. 68 drill.
By pass, size No. 56 (.0465") drill.
Economizer, size No. 63 (.037") drill.
Idle bleed, size No. 55 (.052") drill.

Idle Ports: Upper port, length .165 inch. Width, .030 inch.

Idle Port Opening: .122-.128 inch above upper edge of valve with valve closed tight.

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: 3/4 to 1 1/4 turns open. For richer mixture turn screw out. Idle engine between 450-475 r.p.m. (Syncro-mesh Trans.), 365-385 r.p.m. (Hydra-matic Trans. in neutral), 410-430 r.p.m. (Power Glide—in neutral).

Main Nozzle: In primary venturi, closed tip angle 49° from horizontal. Nozzle is installed permanently. Do not remove.

Metering Rod (Vacumeter Type): Economy step .062 inch diameter. Middle step tapers to .056 inch diameter. Power step .051 inch diameter. Length 3-41/64 inches.

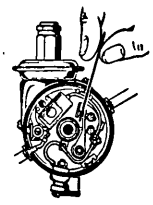
Main Metering Jet: .082 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-163 (2.940 inches).

Accelerating Pump: High pressure delayed action type, (spring operated plunger). Adjustable stroke.
Discharge jet (twin) size, No. 74 (.0225") drill.
Intake disk check size, No. 30 (.1285") drill.
Discharge (needle seat) size, No. 62 (.038") drill.
Relief ball check size, No. 55 (.052") drill.

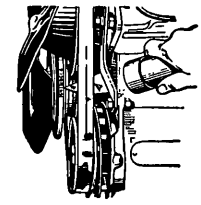
Pump Adjustment: "32" as indicated on gauge T109-117S with thottle valves seated or 20/64" from top of pump shaft to the top of the dust cover housing.

Choke: Carter Climatic® Control, set at center index point. Offset butterfly type. Bleed hole, size .218" diameter (720S), .156" diameter (720SA), .082" diameter (719S-719SA) in valve. Choke heat suction hole, in bowl cover, size No. 32 drill.



Vacuum Spark Port: .062 to .064 inch diameter. Top of port 052 to .056 inch above valve.

Motor Tune-Up—Be Accurate!



CAUTION: *Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.*

CARBURETER ADJUSTMENTS

Float Adjustment: Two separate float adjustments must be made—lateral and vertical, as follows: With bowl cover assembly inverted, gasket removed, and float resting on seated needle, place gauge T109-162 (3/16") directly under float with notched portions of gauge fitted over machined surface of casting. Float should just touch vertical sides of gauge and just clear horizontal portion. Adjust by bending arms of float. Remove gauge, install bowl cover gasket, then reinstall float.

Pump Adjustment: The total distance the plunger head (not shaft) moves from closed to wide open throttle position controls the amount of fuel discharged. Correct pump plunger travel is important and should be checked each time the carbureter is dis-assembled or when leaner than standard metering rods are installed. Procedure is as follows:
Install pump connector link in lower hole (short stroke) of pump arm, with ends extending towards countershaft arm. Back out throttle lever set screw until throttle valves

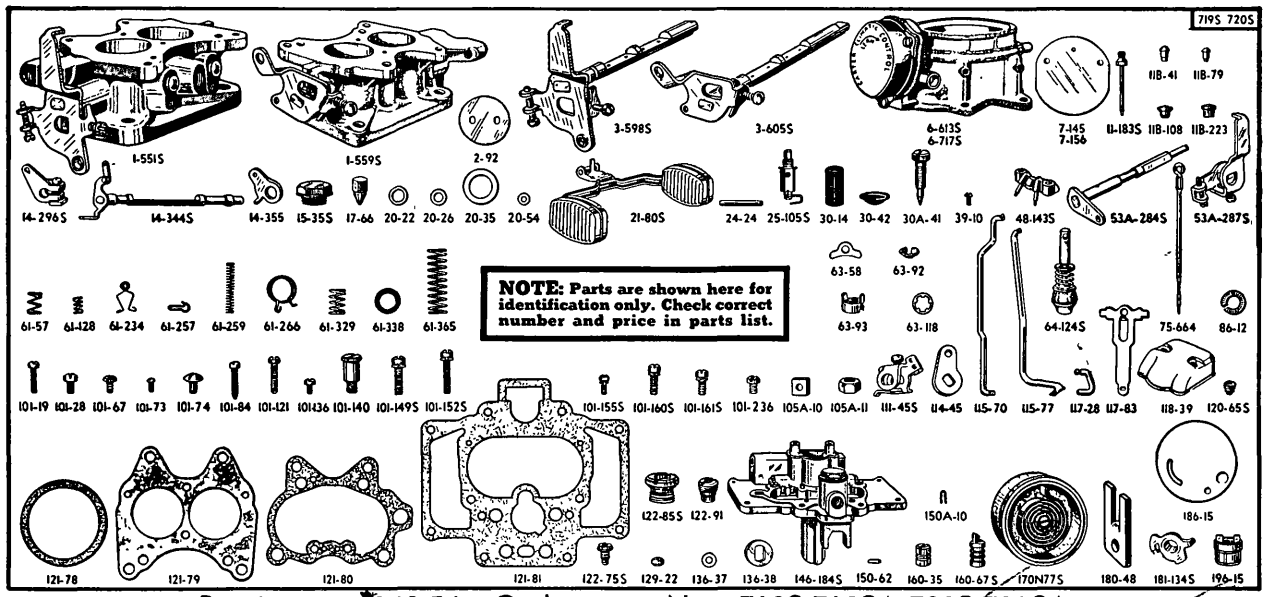
PRINTED IN U.S.A.

seat in bores of carbureter. Be sure fast idle adjusting screw does not hold throttle open. Place universal pump travel gauge T109-117S, inverted on edge of dust cover boss of bowl cover. Turn knurled nut of gauge until finger just touches upper end of plunger shaft. Number indicated on gauge should be "32". Hold the gauge vertical to insure correct reading.

Adjust by bending the throttle connector rod at lower angle.

Optional Adjustment: With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 20/64".



Adjust as mentioned above.

Metering Rod Adjustment: With throttle valves seated in bores of carbureter, insert one metering rod gauge T109-163 in place of either metering rod. Press down lightly on vacuum piston link until lug of piston link contacts lip of metering rod arm. There should be less than .005" clearance between metering rod bearing and shoulder in notch of gauge. Adjust by bending lip of metering rod arm (Tool T109-105).

Fast Idle Adjustment: Loosen choke lever clamp screw on choke shaft. Insert .040" feel gauge T109-193 between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw.

With choke valve tightly closed, tighten fast idle adjusting screw until there is .020" opening between throttle valve and bore of carbureter (side opposite idle port). Use gauge T109-189. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

Unloader Adjustment: With throttle wide open there should be 1/8" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-36). Adjust by bending unloader lip on throttle shaft lever (T109-41).

WCD Dual Down-Draft Climatic® Control Carbs.—**Models 719S-719SA-720S-720SA**

CARBURETER SPECIFICATIONS

(1949-50) For Pontiac 8 Cylinder Engine: 3 1/4 Inch Bore, 3 3/4 Inch Stroke
(1951-54) For Pontiac 8 Cylinder Engine: 3 3/8 Inch Bore, 3 3/4 Inch Stroke

Dimensions: Flange size, 1 1/4 inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 19/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: Distance from seam of float (both sides—at top center) to lower edge of bowl cover, when needle is seated to be 3/16 inch. (Use gauge No. T109-162.)

Vents: Inside, none. Outside, No. 35 (.110) drill—2 holes.

Gasoline Intake: Square vertical push pull needle. Size No. 42 drill in needle seat.

Low Speed Jet Tube: Jet size, No. 68 drill.
By pass, size No. 56 (.0465") drill.
Economizer, size No. 63 (.037") drill.
Idle bleed, size No. 55 (.052") drill.

Idle Ports: Upper port, length .165 inch. Width, .030 inch.

Idle Port Opening: .122-.128 inch above upper edge of valve with valve closed tight.

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: 3/4 to 1 1/4 turns open. For richer mixture turn screw out. Idle engine between 450-475 r.p.m. (Syncro-mesh Trans.), 365-385 r.p.m. (Hydra-matic Trans. in neutral), 410-430 r.p.m. (Power Glide—in neutral).

Main Nozzle: In primary venturi, closed tip angle 49° from horizontal. Nozzle is installed permanently. Do not remove.

Metering Rod (Vacumeter Type): Economy step .062 inch diameter. Middle step tapers to .056 inch diameter. Power step .051 inch diameter. Length 3-41/64 inches.

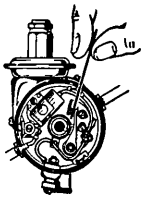
Main Metering Jet: .082 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-163 (2.940 inches).

Accelerating Pump: High pressure delayed action type, (spring operated plunger). Adjustable stroke.
Discharge jet (twin) size, No. 74 (.0225") drill.
Intake disk check size, No. 30 (.1285") drill.
Discharge (needle seat) size, No. 62 (.038") drill.
Relief ball check size, No. 55 (.052") drill.

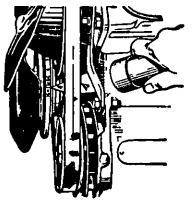
Pump Adjustment: "32" as indicated on gauge T109-117S with thottle valves seated or 20/64" from top of pump shaft to the top of the dust cover housing.

Choke: Carter Climatic® Control, set at center index point. Offset butterfly type. Bleed hole, size .218" diamet r (720S), .156" diameter (720SA), .082" diameter (719S-719SA) in valve. Choke heat suction hole, in bowl cover, size No. 32 drill.



Vacuum Spark Port: .062 to .064 inch diameter. Top of port 052 to .056 inch above valve.

Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARTER
AIR CONDITIONING FAST IDLE DEVICE ASSEMBLY
No. 202-56S
FOR PONTIAC

Used on 719SA, 720SA and 2122S carbureters for cars equipped with air conditioning

Part No.	Part Name	
11B-134	Rivet plug	
49-191S	Electro magnet plunger assembly	
61-302	Adjusting nut spring	
61-438	Diaphragm return spring	
61-502	Electro magnet plunger spring	
86-58	Lock washer	
101-142S	Electro magnet housing attaching screw and washer assembly	(2)
101-213S	Diaphragm cover attaching screw and washer assembly	(6)
101-362S	Bracket attaching screw and washer assembly	(2)
101-379S	Bracket attaching screw and washer assembly	
105A-12	Lock nut	
105A-49	Bracket attaching nut	
105A-53	Adjusting nut	
116-13	Check ball	
121-190	Electro magnet housing gasket	
150-168	Diaphragm air bleed pin	
170-190	Inner diaphragm housing	
170-298S	Outer diaphragm housing and plug assembly	
180-77	Bracket	
202-56S	Air conditioning fast idle device assembly (complete)	
202-59S	Diaphragm and shaft assembly	
213-14S	Electro magnet and housing assembly	

NOTE Figures in parenth ses indicate number of pieces used in the idle d vic ass mbly. Where n figure is sh wn, only ne is us d.

Casting No. 388 on face of flange (717S)
Casting No. 592 on face of flange (718S)

PONTIAC SIX MODELS "49-25" – "50-25" "51-25" 1949-1951 "52-25" – 1952

WA-1 Down-Draft **Carbureters 717S-718S** With Climatic® Control

CARBURETER SPECIFICATIONS

For Pontiac 6 Cylinder Engine· 3-9/16" Bore, 4" Stroke

Dimensions. Flange size 1¼ inch S A E
Primary venturi, 11/32 inch I D
Secondary venturi, 11/16 inch I D
Main venturi, 1-5/16 inch I D

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover when needle is seated to be 7/16 inch

Vents· Outside, No 10 drill Inside none

Gasoline Intake: Square vertical push pull needle Size No 38 drill hole in needle seat

Low Speed Jet Tube: Jet size No 67 drill
By pass size No 54 drill
Economizer 0665 0675 inch diameter
Idle bleed, size No 50 drill

Idle Port: Keyhole type length 210 inch width 036 inch, with 063 inch diameter hole at top

Idle Port Opening· Top of port located 166 to 170 inch above valve with valve closed tight

Idle Screw Seat: No 46 drill

Set Idle Adjustment Screw: 1 to 1¾ turns open For richer mixture turn screw out Do not attempt to idle engine below 450 475 r p m (717S) 370 380 r p m (718S)

Main Nozzle In primary venturi angle 45° Closed tip Inside diameter No 30 drill
Upper hole 020 inch diameter on 45° angle
Lower hole 070 inch diameter on 60° angle

Metering Rod (Vacumeter Type): Economy step 075 inch diameter middle step tapers to 070 inch diameter power step 042 inch diameter
Length 3 9/64 inches

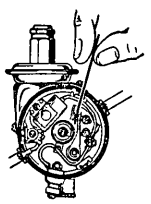
Metering Rod Jet· 0995 inch diameter

Metering Rod Setting Use gauge part No T109-102 (2 468 inches)

Accelerating Pump Pressure type, with adjustable pump stroke
Pump discharge jet size No 72 (.025") drill
Relief passage to outside size No 42 drill
Intake ball check seat, size No 55 drill
Discharge ball check seat size No 32 drill

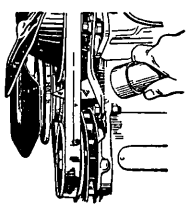
Pump Adjustment: 17/64 inch plunger travel (full throttle position) Lower hole (medium stroke) Use Gauge T109-117S

Choke· Carter Climatic® Control, set 3 points rich Butterfly type offset valve Bleed hole (in valve), size No 28 (.1405") drill Choke heat suction hole in body size No 38 (.1015") drill



Vacuum Spark Port· 061 to 064 inch diameter Bottom of port 022 to 027 inch above valve

Motor Tune-Up—Be Accurate!



CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

CARBURETER ADJUSTMENTS

Pump Adjustment. With throttle valve seated and connector link in medium stroke (lower hole), pump plunger should travel 17/64" from closed to wide open position Pump travel can be measured by using universal pump stroke gauge T109-117S Place base of gauge on ridged portion of bowl cover so that projecting portion of pump gauge rests on top surface of connector link at pump shaft Hold gauge vertical The difference between the number shown by index mark on gauge at wide open and closed throttle positions, should be "17"

Adjust by bending throttle connector rod at lower angle

Metering Rod Adjustment: Correct setting of metering rod is important and must be made after pump adjustment Metering rod position should be checked when carbureters

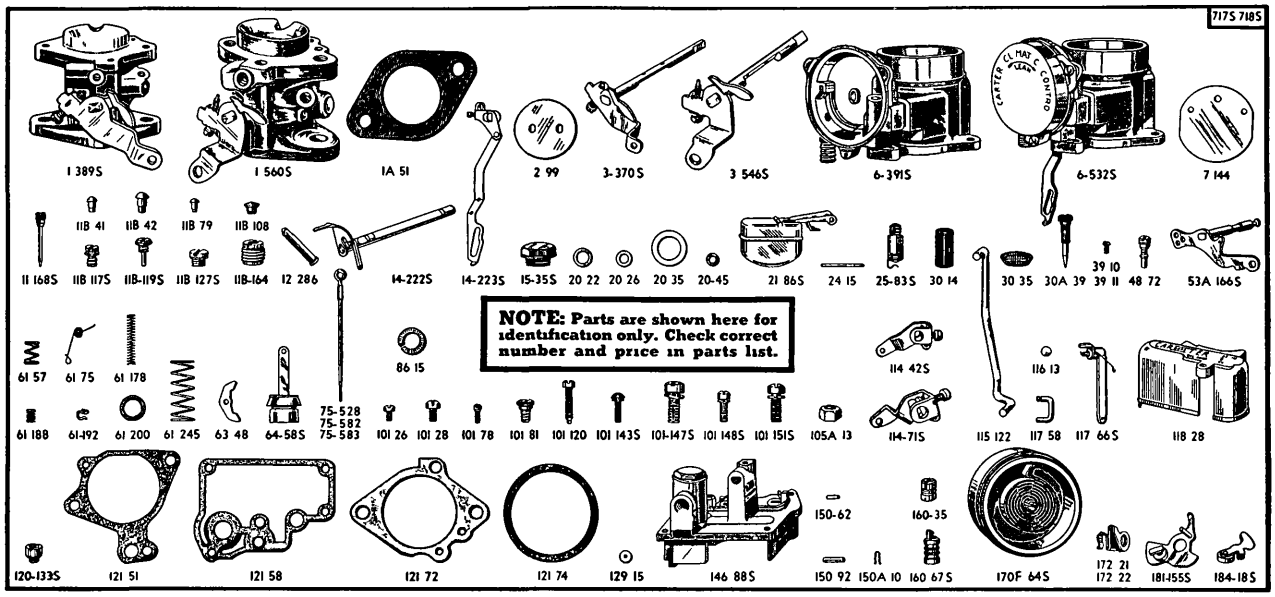
CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

PRINTED IN U.S.A.

are serviced or leaner than standard rods are installed Correct procedure is as follows

1 Back out throttle lever set screw so throttle valve seats
2 Insert gauge T109-102 in place of metering rod, seating tapered end in metering rod jet
3 Press lightly on vacuum piston arm until lip on arm contacts pump operating lever
4 There should be less than .005" clearance between metering rod pin and shoulder in notch of gauge
5 Adjustment should be made by bending lip on vacuum piston arm (use tool T109-22)
6 Remove gauge and install metering rod and disk Connect metering rod spring



Anti percolator Adjustment Crack throttle valve .030" by placing gauge T109 29 between throttle valve and bore of carbureter (side opposite port) Bend rocker arm (use tool T109-105) until there is a clearance of .005" to .015" between rocker arm lip and pump arm

Fast Idle Adjustment Back out throttle lever adjusting screw Hold fast idle cam in normal idle position (choke wide open) and tighten throttle lever adjustment screw until it just touches fast idle cam Hold throttle lever closed and pull cam back until first (or lower) step on cam is against (not on) set screw

There should now be 5/8" clearance between inner wall of air horn and lower edge of choke valve (Use gauge T109-85) Adjustment can be made by bending at offset portion of fast idle link with tool T109-41

Unloader Adjustment With throttle valve wide open there should be 5/16" clearance between lower edge of choke valve and inner wall of air horn (Use tool T109-107) Adjustment should be made by bending arm on throttle lever (Use tool T109-41)

Lock-out Adjustment With throttle and choke valves wide open, choke should lock in wide open position Adjustment is made by bending lip at lower edge of fast idle link to give 1/32" clearance between lip and throttle lever lock with throttle and choke valves held wide open (Use tool T109-22)

Pontiac 6—1949-1952—Carbureters Nos. 717S-718S

WHEN SERVICING, USE GASKET ASSORTMENT No. 146, REPAIR PACKAGE No 1366B (717S), No 1388A (718S)

Casting No. 558 on Face of Flange

PONTIAC EIGHT MODELS "48-27" & "48-28" 1948

(HYDRAMATIC TRANSMISSION)

(720SA can also be used)

WCD Dual Down-Draft Climatic® Control Carbureter—**Model 653S**

CARBURETER SPECIFICATIONS

For Pontiac 8 Cylinder Engine: 3 1/4 Inch Bore, 3 3/4 Inch Stroke

Dimensions: Flange size, 1 1/4 inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 19/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: Distance from seam of float (both sides—at top center) to lower edge of bowl cover, when needle is seated to be 3/16 inch. (Use gauge No. T109-162.)

Vents: Inside, balance vent tube .218 inch inside diameter. Outside, none.

Gasoline Intake: Square vertical push pull needle. Size No. 42 drill in needle seat.

Low Speed Jet Tube: Jet size, No. 68 drill.
By-pass, size No. 56 (.0465") drill.
Economizer, size No. 63 (.037") drill.
Idle bleed, size No. 55 (.052") drill.

Idle Ports: Upper port, length .165 inch. Width .030 inch.

Idle Port Opening: .122-.128 inch above upper edge of valve with valve closed tight.

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: 3/4 to 1 3/4 turns open. For richer mixture turn screw out. Do not attempt to idle engine below 8 m.p.h.

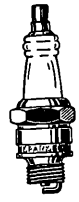
Main Nozzle: In primary venturi, closed tip angle 49° from horizontal. Nozzle is installed permanently. **Do not remove.**

Metering Rod (Vacumeter Type): Economy step .060 inch diameter. Middle step tapers to .051 inch diameter. Power step .045 inch diameter. Length 3-41/64 inches.

Main Metering Jet: .082 inch diameter.

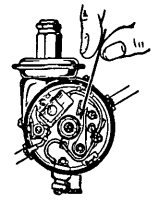
Metering Rod Setting: Use gauge, part No. T109-163 (2.940 inches).

Accelerating Pump: High pressure delayed action type, (spring operated plunger). Adjustable stroke.
Discharge jet (twin) size, No. 74 (.0225") drill.
Intake disk check size, No. 30 (.1285") drill.
Discharge (needle seat) size, No. 55 (.052") drill.
Relief ball check size, No. 55 (.052") drill.



Pump Adjustment: "30" as indicated on gauge T109-117S with throttle valves seated or 18/64" from top of pump shaft to the top of the dust cover housing.

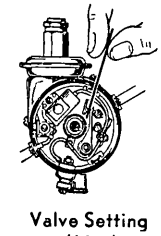
Choke: Carter Climatic® Control, set at center index point. Offset butterfly type. Choke heat suction hole, in bowl cover, size No. 32 drill.



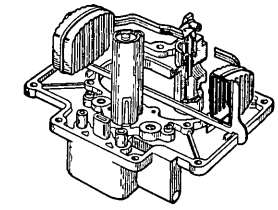
Vacuum Spark Port: .062 to .064 inch diameter. Top of port .052 to .056 inch above valve.

Motor Tune-Up—Be Accurate!

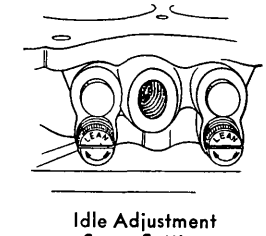
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .025"



Breaker Point Setting .015"



Ignition Timing Breaker Points to Open: 2°-6° B. T. C.

Valve Setting (Hot)
Int. .011"-.013"
Exh. .011"-.013"

Float Setting 3/16 Inch (Use Gauge T109-162)

Idle Adjustment Screw Setting 3/4 to 1 3/4 Turns Open

CARBURETER ADJUSTMENTS

Float Adjustment: Two separate float adjustments must be made—lateral and vertical, as follows: With bowl cover assembly inverted, gasket removed, and float resting on seated needle, place gauge T109-162 (3/16") directly under float with notched portions of gauge fitted over machined surface of casting. Float should just touch vertical sides of gauge, and just clear horizontal portion. Adjust by bending arms of float. Remove gauge, install bowl cover gasket, then reinstall float.

Pump Adjustment: The total distance the plunger head (not shaft) moves from closed to wide open throttle position controls the amount of fuel discharged. Correct pump plunger travel is important and should be checked each time the carbureter is dis-assembled or when leaner than standard metering rods are installed. Procedure is as follows:

Install pump connector link in lower hole (short stroke) of pump arm, with ends extending towards countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Be sure fast idle adjusting screw does not hold throttle open. Place universal pump travel

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

gauge T109-117S, inverted on edge of dust cover boss of bowl cover Turn knurled nut of gauge until finger just touches upper end of plunger shaft Number indicated on gauge should be '30' Hold the gauge vertical to insure correct reading

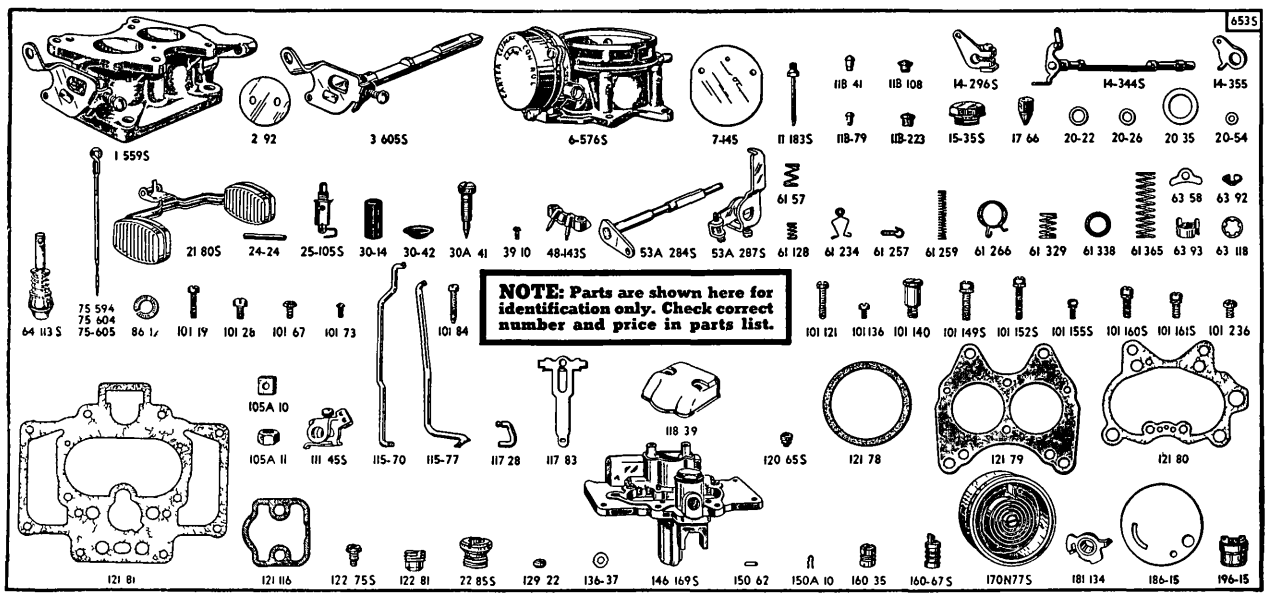
Adjust by bending the throttle connector rod at lower angle

Optional adjustment With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 18/64

Adjust as mentioned above

Metering Rod Adjustment With throttle valves seated in bores of carbureter insert one metering rod gauge T109-163 in place of either metering rod Press down lightly on vacuum piston link until lug of piston link contacts lip of metering rod arm There should be less than 005 clearance between metering rod bearing and shoulder in notch of gauge Adjust by bending lip of metering rod arm (Tool T109-105)

Fast Idle Adjustment With choke valve tightly closed tighten fast idle adjusting screw until there is 026' opening between throttle valve and bore of carbureter (side opposite idle port) Use gauge T109 189 Be sure fast idle adjusting screw is on high step of cam while making this adjustment



Unloader Adjustment Two adjustments are necessary

A Loosen choke lever clamp screw on choke shaft Insert 040" feeler gauge T109-193 between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw

B With throttle wide open there should be ⅛" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-36) Adjust by bending unloader lip on throttle shaft lever (T109-41)

NOTE Assemble flange in the following manner

1 Install throttle shaft assembly and turn to closed position
2 Press retaining ring (prongs extending away from casting) on throttle shaft so that it is against boss on casting
3 Install throttle valves with "c toward idle ports (viewed from manifold side of flange) Center valves by tapping lightly, hold in place and tighten screws

Vents: Inside, balance vent tube 218 inch inside diameter Outside, none

Gasoline Intake: Square vertical push pull needle Size No 42 drill in needle seat.

Low Speed Jet Tube: Jet size, No. 68 drill
By-pass, size No 56 (.0465") drill.
Economizer, size No. 63 (037") drill
Idle bleed, size No. 55 (.052") drill

Idle Ports: Upper port, length .165 inch. Width 030 inch

Idle Port Opening: .122-.128 inch above upper edge of valve with valve closed tight.

Lower Port (For Idle Adjustment Screw): Size .0615 to 0655 inch diameter.

Set Idle Adjustment Screw: 3/4 to 1 3/4 turns open For richer mixture turn screw out. Do not attempt to idle engine below 8 m p.h

Main Nozzle: In primary venturi, closed tip angle 49° from horizontal. Nozzle is installed permanently **Do not remove**

Metering Rod (Vacumeter Type): Economy step .060 inch diameter. Middle step tapers to 051 inch diameter. Power step 045 inch diameter. Length 3-41/64 inches

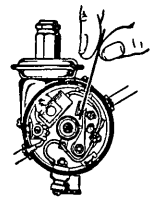
Main Metering Jet: 082 inch diameter

Metering Rod Setting: Use gauge, part No. T109-163 (2.940 inches)

Accelerating Pump: High pressure delayed action type, (spring operated plunger). Adjustable stroke
Discharge jet (twin) size No. 74 (0225") drill
Intake disk check size, No 30 (1285") drill
Discharge (needle seat) size, No. 55 (052") drill
Relief ball check size No. 55 (.052") drill

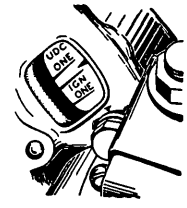
Pump Adjustment: "30" as indicated on gauge T109-117S with throttle valves seated or 18/64" from top of pump shaft to the top of the dust cover housing.

Choke: Carter Climatic® Control, set at center index point Offset butterfly type Choke heat suction hole, in bowl cover, size No. 32 drill

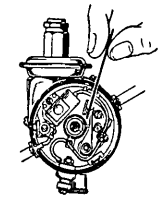


Vacuum Spark Port: 062 to 064 inch diameter Top of port 052 to 056 inch above valve

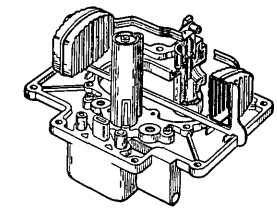
Motor Tune-Up—Be Accurate!



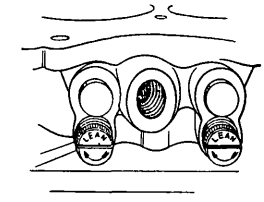
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .025"



Breaker Point Setting 015"



Ignition Timing Breaker Points to Open· 2°-6° B. T. C.

Valve Setting (Hot)
Int. 011"-.013"
Exh 011"-.013"

Float Setting 3/16 Inch (Use Gauge T109-162)

Idle Adjustment Screw Setting 3/4 to 1 3/4 Turns Open

CARBURETER ADJUSTMENTS

Float Adjustment: Two separate float adjustments must be made—lateral and vertical, as follows. With bowl cover assembly inverted, gasket removed, and float resting on seated needle, place gauge T109-162 (3/16") directly under float with notched portions of gauge fitted over machined surface of casting Float should just touch vertical sides of gauge, and just clear horizontal portion Adjust by bending arms of float Remove gauge, install bowl cover gasket, then reinstall float

Pump Adjustment: The total distance the plunger head (not shaft) moves from closed to wide open throttle position controls the amount of fuel discharged. Correct pump plunger travel is important and should be checked each time the carbureter is dis-assembled or when leaner than standard metering rods are installed Procedure is as follows:

Install pump connector link in lower hole (short stroke) of pump arm, with ends extending towards countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter. Be sure fast idle adjusting screw does not hold throttle open Place universal pump travel

CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

PRINTED IN U.S.A.

gauge T109-117S, inverted on edge of dust cover boss of bowl cover Turn knurled nut of gauge until finger just touches upper end of plunger shaft Number indicated on gauge should be "30' Hold the gauge vertical to insure correct reading

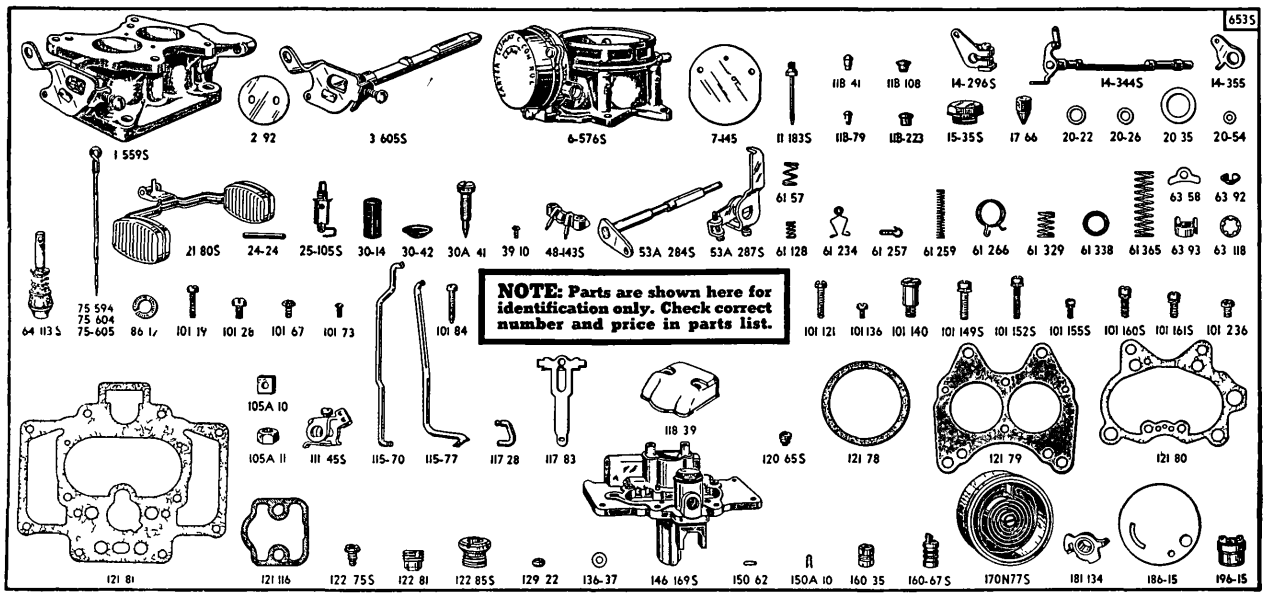
Adjust by bending the throttle connector rod at lower angle

Optional adjustment With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 18/64'

Adjust as mentioned above

Metering Rod Adjustment· With throttle valves seated in bores of carbureter insert one metering rod gauge T109-163 in place of either metering rod Press down lightly on vacuum piston link until lug of piston link contacts lip of metering rod arm There should be less than 005' clearance between metering rod bearing and shoulder in notch of gauge Adjust by bending lip of metering rod arm (Tool T109-105)

Fast Idle Adjustment With choke valve tightly closed tighten fast idle adjusting screw until there is 026 opening between throttle valve and bore of carbureter (side opposite idle port) Use gauge T109-189 Be sure fast idle adjusting screw is on high step of cam while making this adjustment



Unloader Adjustment: Two adjustments are necessary

A Loosen choke lever clamp screw on choke shaft Insert 040" feeler gauge T109-193 between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw

B With throttle wide open there should be ⅛" clearance between upper edge of choke valve and inner wall of air horn (gauge T109-36) Adjust by bending unloader lip on throttle shaft lever (T109-41)

NOTE. Assemble flange in the following manner

1 Install throttle shaft assembly and turn to closed position
2 Press retaining ring (prongs extending away from casting) on throttle shaft so that it is against boss on casting
3 Install throttle valves with "c" toward idle ports (viewed from manifold side of flange) Center valves by tapping lightly, hold in place and tighten screws

Pontiac 8—1948—Carbureter No. 653S

PONTIAC SIX MODELS "48-25" & "48-26" 1948

(HYDRAMATIC TRANSMISSION)

Casting Number 592 on face of flange

WA-1 Down-Draft **Carbureter 652S** With Climatic® Control

CARBURETER SPECIFICATIONS

For Pontiac 6 Cylinder Engine: 3-9/16" Bore, 4" Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1-5/16 inch I. D.

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover, when needle is seated, to be 7/16 inch

Vents: Outside, No. 10 drill. Inside, none.

Gasoline Intake: Square vertical push pull needle. Size No. 38 drill hole in needle seat

Low Speed Jet Tube: Jet size No. 67 drill
By-pass, size No. 54 drill.
Economizer, .0665-.0675 inch diameter
Idle bleed, size No. 50 drill.

Idle Port: Keyhole type, length .210 inch· width .036 inch with 063 inch diameter hole at top.

Idle Port Opening: Top of port located 166 to .170 inch above valve with valve closed tight.

Idle Screw Seat: No. 46 drill.

Set Idle Adjustment Screw: 1 to 1¾ turns open. For richer mixture, turn screw out. Do not attempt to idle engine below 350 r.p.m.

Main Nozzle: In primary venturi, angle 45°. Closed tip Inside diameter, No. 30 drill.
Upper hole: .020 inch diameter on 45° angle
Lower hole· .070 inch diameter on 60° angle.

Metering Rod (Vacumeter Type): Economy step, .075 inch diameter, middle step tapers to 070 inch diameter; power step .042 inch diameter
Length 3-9/64 inches

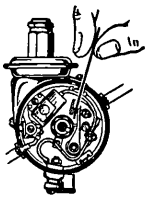
Metering Rod Jet: .0995 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-102 (2.468 inches)

Accelerating Pump: Low pressure type, with adjustable pump stroke
Pump discharge jet, size No. 72 (.025") drill
Relief passage to outside, size No. 42 drill
Intake ball check seat, size No. 55 drill
Discharge ball check seat, size No. 32 drill

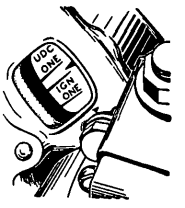
Pump Adjustment: 17/64 inch plunger travel (full throttle position). Lower hole (medium stroke). Use Gauge T109-117S

Choke: Carter Climatic® Control, set 3 points rich. Butterfly type, offset valve Bleed hole, size No. 28 (.1405") drill. Choke heat suction hole, in body, size No. 41 (.096") drill.

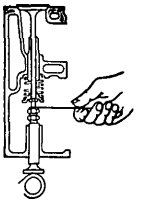


Vacuum Spark Port: .061 to .064 inch diameter. Bottom of port 022 to 027 inch above valve.

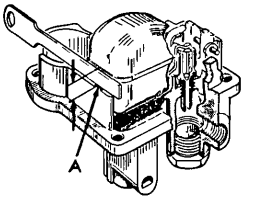
Motor Tune-Up—Be Accurate!



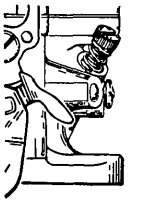
CAUTION· Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap .025"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: 2°-6° B. T. D. C.

Valve Setting (Hot)
Int. .011"-.013"
Exh. .011"-.013"

Float Setting 7/16 Inch (Measure from point "A" to top of float seam)

Idle Adjustment Screw Setting 1 to 1¾ Turns Open

CARBURETER ADJUSTMENTS

Pump Adjustment With throttle valve seated and connector link in medium stroke (lower hole), pump plunger should travel 17/64" from closed to wide open position Pump travel can be measured by using universal pump stroke gauge T109-117S Place base of gauge on ridged portion of bowl cover so that projecting portion of pump gauge rests on top surface of connector link at pump shaft Hold gauge vertical The difference between the number shown by index mark on gauge, at wide open and closed throttle positions, should be "17".

Adjustment should be made by bending throttle connector rod at lower angle

Metering Rod Adjustment: Correct setting of metering rod is important and must be made after pump adjustment Metering rod position should be checked when carbureters are serviced or leaner than standard rods are installed Correct procedure is as follows

1 Back out throttle lever set screw so throttle valve seats
2 Insert gauge T109-102 in place of metering rod, seating tapered end in metering rod jet

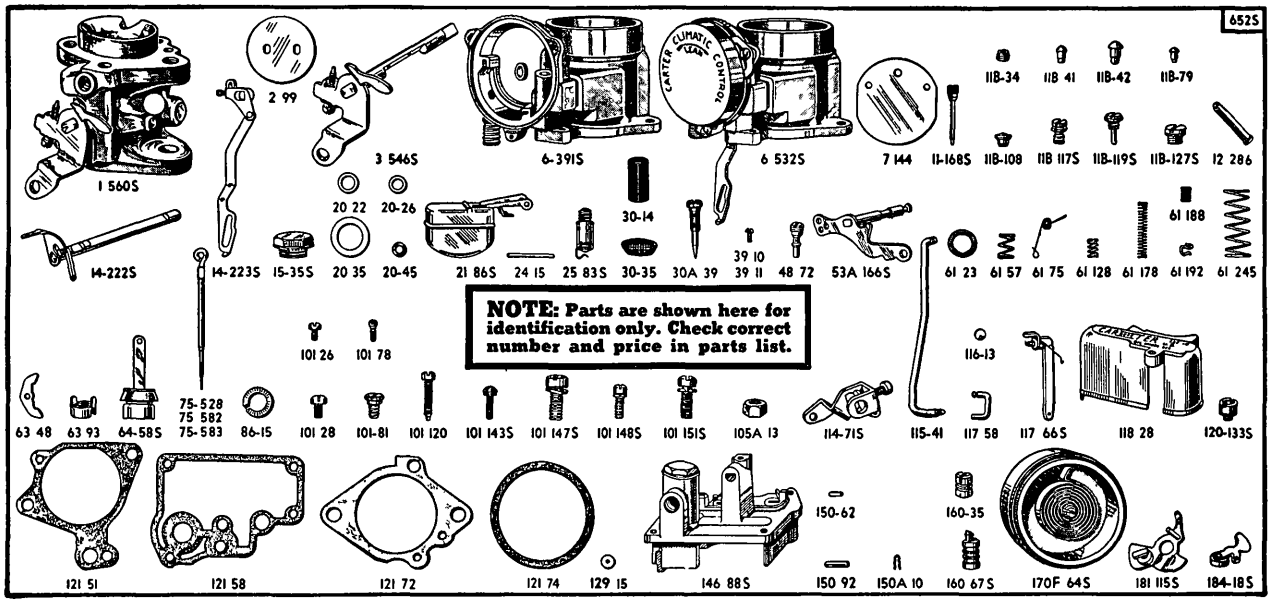
CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

3 Press lightly on vacuum piston arm until lip on arm contacts pump operating lever
4 There should be less than .005" clearance between metering rod pin and shoulder in notch of gauge
5 Adjustment should be made by bending lip on vacuum piston arm (use tool T109-22)
6 Remove gauge, and install metering rod and disk Connect metering rod spring



Anti-Percolator Adjustment Crack throttle valve .030' by placing gauge T109-29 between throttle valve and bore of carbureter (side opposite port) Bend rocker arm (use tool T109-105) until there is a clearance of .005" to .015' between rocker arm lip and pump arm

Fast Idle Adjustment Back out throttle lever adjusting screw Hold fast idle cam in normal idle position (choke wide open) and tighten throttle lever adjusting screw until it just touches fast idle cam Hold throttle lever closed and pull cam back until first (or lower) step on cam is against (not on) set screw

There should now be 5/8" clearance between inner wall of air horn and lower edge of choke valve (Use gauge T109-85) Adjustment can be made by bending at offset portion of fast idle link with tool T109-41

Unloader Adjustment With throttle valve wide open there should be 5/16 clearance between lower edge of choke valve and inner wall of air horn (Use tool T109-107) Adjustment should be made by bending arm on throttle lever (Use tool T109-41)

Lock-Out Adjustment With throttle and choke valves wide open, choke should lock in wide open position Adjustment is made by bending lip at lower end of fast idle link to give 1/32 clearance between lip and throttle lever lock, with throttle and choke valves held wide open (use tool T109-22)

Pontiac 6—1948—Carbureter No. 652S

CARBURETER SPECIFICATIONS

For Pontiac 6 Cylinder Engine, 3-9/16" Bore, 4" Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1-5/16 inch I. D.

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover, when needle is seated, to be 7/16 inch.

Vents: Outside, No. 10 drill. Inside, none.

Gasoline Intake: Square vertical needle. Size No. 38 drill hole in needle seat.

Low Speed Jet Tube: Jet size, No. 67 drill.
By-pass, size No. 54 drill.
Economizer, .0665-.0675 inch diameter.
Idle bleed, size No. 50 drill.

Idle Port: Keyhole type, length .210 inch; width .036 inch, with .063 inch diameter hole at top.

Idle Port Opening: Top of port located .166 to .170 inch above valve with valve closed tight.

Idle Screw Seat: No. 46 drill.

Set Idle Adjustment Screw: 1 to 1¾ turns open. For richer mixture, turn screw out. Do not attempt to idle engine below 350 r.p.m.

Main Nozzle: In primary venturi, angle 45°. Closed tip. Inside diameter, No. 30 drill.
Upper hole: .020 inch diameter on 45° angle.
Lower hole: .070 inch diameter on 60° angle.

Metering Rod (Vacumeter Type): Economy step, .075 inch diameter; middle step tapers to .070 inch diameter; power step, .042 inch diameter.
Length 3-9/64 inches.

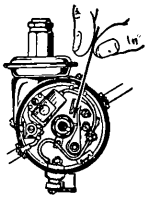
Metering Rod Jet: .0995 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-102 (2.468 inches).

Accelerating Pump: Low pressure type, with adjustable pump stroke.
Pump discharge jet, size No. 72 drill.
Relief passage to outside, size No. 42 drill.
Intake ball check seat, size No. 55 drill.
Discharge ball check seat, size No. 32 drill.

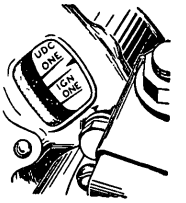
Pump Adjustment: 17/64 inch plunger travel (full throttle position). Lower hole (medium stroke). Use Gauge T109-117S.

Choke: Carter Climatic® Control, set 3 points rich. Butterfly type, offset valve. Bleed hole, size No. 28 (.1405") drill. Choke heat suction hole, in body, size No. 41 (.096") drill.



Vacuum Spark Port: .061 to .064 inch diameter. Bottom of port .022 to .027 inch above valve.

Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



CAUTION: **Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.**

CARBURETER ADJUSTMENTS

Pump Adjustment: With throttle valve seated and connector link in medium stroke (lower hole), pump plunger should travel 17/64 inch from closed to wide open position. Pump travel can be measured by using universal pump stroke gauge T109-117S. Place base of gauge on ridged portion of bowl cover so that projecting portion of pump gauge rests on top surface of connector link at pump shaft. Hold gauge vertical. The difference between the number shown by index mark on gauge, at wide open and closed throttle positions, should be "17."

Adjustment should be made by bending throttle connector rod at lower angle.

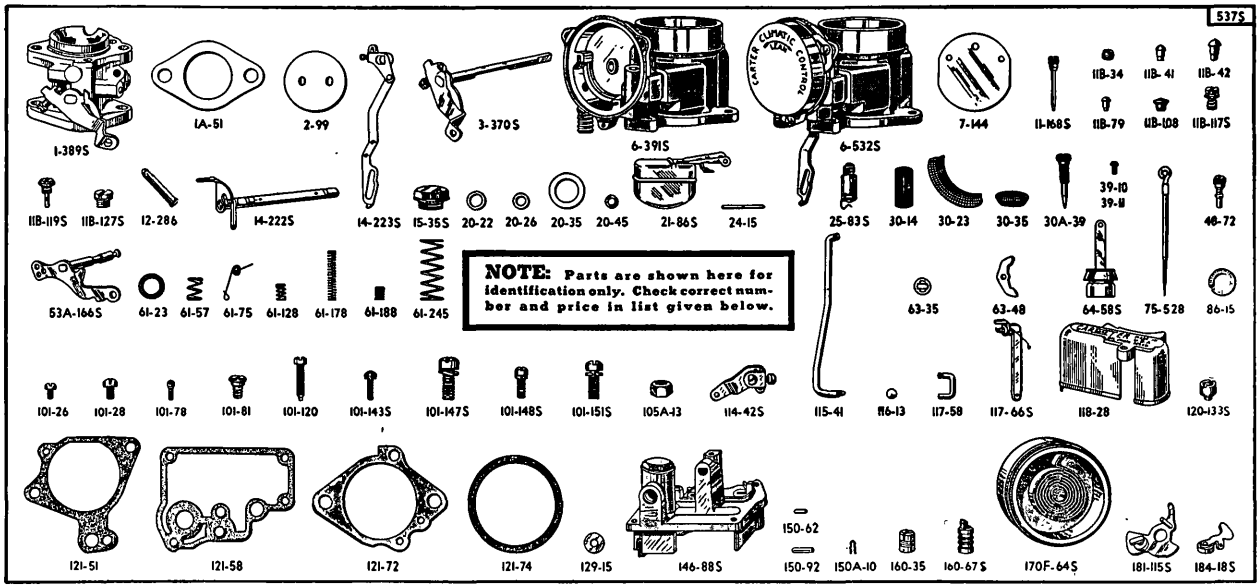
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

Metering Rod Adjustment: Correct setting of metering rod is important and must be made after pump adjustment. Metering rod position should be checked when carbureters are serviced or leaner than standard rods are installed. Correct procedure is as follows:

1. Back out throttle lever set screw so throttle valve seats.
2. Insert gauge (T109-102) in place of metering rod, seating tapered end in metering rod jet.
3. Press lightly on vacuum piston arm until lip on arm contacts pump operating lever.
4. There should be less than .005" clearance between metering rod pin and shoulder in notch of gauge.
5. Adjustment should be made by bending lip on vacuum piston arm (use tool T109-22).
6. Remove gauge, and install metering rod and disk. Connect metering rod spring.



Anti-Percolator Adjustment: Crack throttle valve .030" by placing gauge T109-29 between throttle valve and bore of carbureter (side opposite port). Bend rocker arm (use Tool T109-105) until there is a clearance of .005" to .015" between rocker arm lip and pump arm.

Fast Idle Adjustment: Back out throttle lever adjusting screw. Hold fast idle cam in normal idle position (choke wide open) and tighten throttle lever adjusting screw until it just touches fast idle cam. Hold throttle lever closed and pull cam back until first (or lower) step on cam is against (not on) set screw.

There should now be 5/8" clearance between inner wall of air horn and lower edge of choke valve. (Use gauge T109-85) Adjustment can be made by bending at offset portion of fast idle link with Tool T109-41.

Unloader Adjustment: With throttle valve wide open there should be 5/16" clearance between lower edge of choke valve and inner wall of air horn. (Use Tool T109-107) Adjustment should be made by bending arm on throttle lever. (Use Tool T109-41)

Lock-out Adjustment: With throttle and choke valves wide open, choke should lock in wide open position. Adjustment is made by bending lip at lower end of fast idle link to give 1/32" clearance between lip and throttle lever lock, with throttle and choke valves held wide open. (Use Tool T109-22)

Pontiac 6—1946-47-48—Carbureter 537S

WHEN SERVICING, USE GASKET ASSORTMENT No. 146; REPAIR PARTS PKG. No. 1366B

(719SA can also be used)

Casting Number on Face of Flange: 630S—373; 630SA, 630SB—550.

WCD Dual Down-Draft Climatic® Control Carbs.—**Models 630S-630SA-630SB**

CARBURETER SPECIFICATIONS

For Pontiac 8 Cylinder Engine: 3¼ Inch Bore, 3¾ Inch Stroke

Dimensions: Flange size 1¼ inch dual 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 19/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: Distance from seam of float (both sides—at top center) to lower edge of bowl cover, when needle is seated to be 3/16 inch. (Use gauge No. T109-162.)

Vents: Inside, balance vent tube .218 inch inside diameter. Outside, none.

Gasoline Intake: Square vertical needle. Size No. 42 drill in needle seat.

Low Speed Jet Tube: Jet size, No. 68 drill
By-pass, size No. 56 drill.
Economizer, size No. 63 drill.
Idle bleed, size No. 55 drill.

Idle Ports: Upper port, length .165 inch. Width .030 inch.

Idle Port Opening: (Early production) .117 to .123 inch above upper edge of valve with valve closed tight. (Late production) .122-.128 inch above upper edge of valve with valve closed tight

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: ¾ to 1¾ turns open For richer mixture turn screw out. Do not attempt to idle engine below 8 m.p.h.

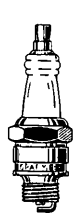
Main Nozzle: In primary venturi, closed tip angle 49° from horizontal. Nozzle is installed permanently. **Do not remove**

Metering Rod (Vacumeter Type): Economy step 060 inch diameter Middle step tapers to 051 inch diameter. Power step .045 inch diameter. Length 3-41/64 inches.

Metering Rod Jet: 082 inch diameter.

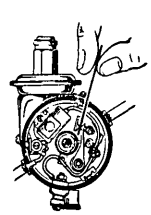
Metering Rod Setting: Use gauge part No T109 163 (2940 inches).

Accelerating Pump: High pressure delayed action type Adjustable stroke
Discharge jet (twin) size, No. 74 drill.
Intake disk check size No. 30 drill
Discharge (needle seat) size, No 55 drill
Relief ball check size No. 55 drill.



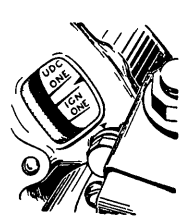
Pump Adjustment: 30 as indicated on gauge T109-117S with throttle valves seated or 18/64" from top of pump shaft to the top of the dust cover housing

Choke: Carter Climatic® Control, set on index (6-547S), one point lean (6-576S) Offset butterfly type Choke heat suction hole, in bowl cover, size No. 32 drill

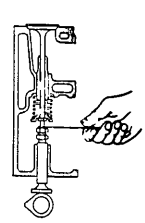


Vacuum Spark Port: 062 to 064 inch diameter. Top of port .052 to .056 inch above valve.

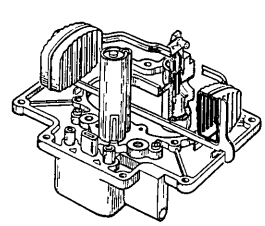
Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



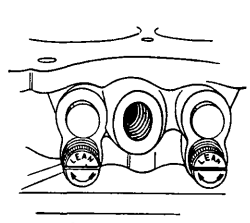
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .023"-.028"



Breaker Point Setting .015"



Ignition Timing Breaker Points to Open: 2°-6° B. T. C

Valve Setting (Hot) Min. .011" Max. .013"

Float Setting 3/16 Inch (Use Gauge T109-162)

Idle Adjustment Screw Setting ¾ to 1¾ Turns Open

CARBURETER
TRADE MARK REG. U. S. PAT. FF.
MARCA REGISTRADA

PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENTS Two separate float adjustments must be made—lateral and vertical

LATERAL ADJUSTMENT (Fig 1) With bowl cover assembly inverted bowl cover gasket removed and float lip resting on seated needle place float gauge T109 162 directly under float with notched portions of gauge fitted over edges of casting Sides of floats should barely touch the vertical uprights of float gauge (A) Adjustment should be made by bending arms of floats

VERTICAL ADJUSTMENTS (Fig 1) With float gauge in position shown floats should just clear the horizontal portion of gauge (B) Vertical distance between top of float and ma chined surface of casting must be 3/16" Adjust by bending float arms Remove float install bowl cover gasket and then reinstall float

PUMP ADJUSTMENT (Fig 2) The accelerating pump has been designed to produce a uniform pump action The total distance the plunger head (not shaft) moves from closed to wide open throttle controls the amount of fuel discharged Correct pump plunger travel is important and should be checked each t me the carbureter is disassembled Procedure is as follows

Install pump connector link in lower ho e (short stroke) with ends extending toward countershaft arm Back out throttle lever set screw to allow throttle valves to seat in bores of car bureter Be sure fast idle adjusting screw does not hold throttle

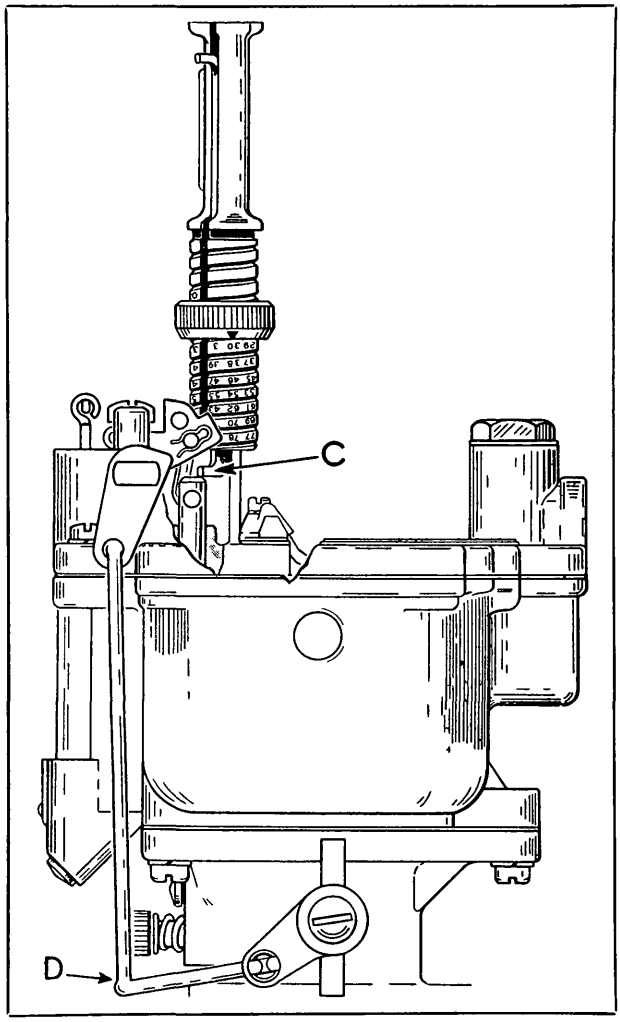

Figure 2

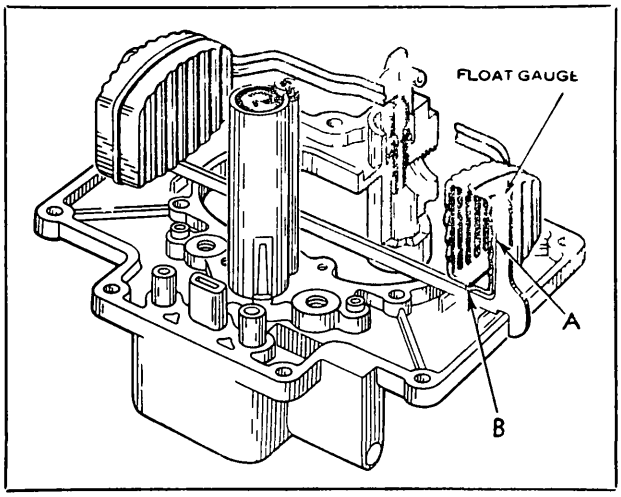

Figure 1

open Place pump travel gauge T109 117S inverted on edge of dust cover boss of bowl cover as shown Turn knurled nut of gauge until finger (C) just touches upper end of plunger shaft with throttle valves seated Number indicated on gauge should be 30 Hold gauge vertical to insure correct reading Adjust by bending throttle connector rod at lower angle (D)

PUMP JET ADJUSTMENT (Fig 3) Good acceleration per formance at low speeds depends primarily on the gasoline d s charged from the pump jets Each of the two streams must be directed to its proper section of the dual venturi system In order to obtain maximum efficiency each stream must be direc ted to a point between the primary and secondary venturi missing the outer wall of the primary venturi but striking the lower part of the inner wall of the secondary venturi

Only a slight bend should be necessary to properly aim the pump jets

METERING ROD ADJUSTMENT (Fig 4) Back out throttle lever adjusting screw until throttle valves seat in bores of car bureter Be sure fast idle adjusting screw does not hold throttle open Insert one metering rod gauge T109 163 n place of either metering rod Press down lightly on vacuum piston link (E) until lug of piston link (F) contacts lip of metering rod arm (G) There should be less than 005" clearance between metering rod bearing (H) and shoulder in notch of gauge Adjustment should be made by bending lip of metering rod arm (G) Use bending tool T109 105

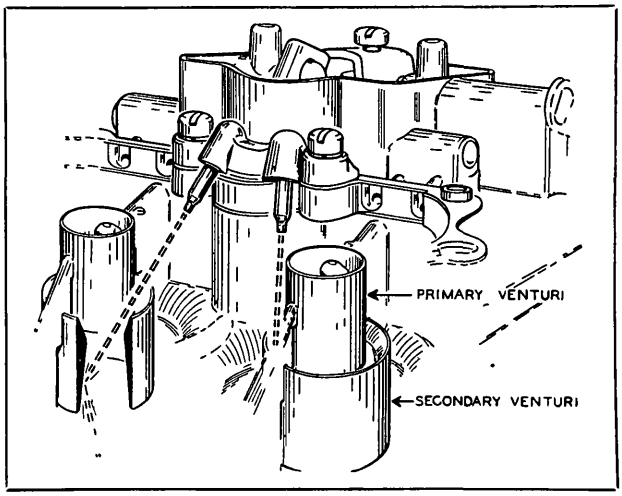

Figure 3

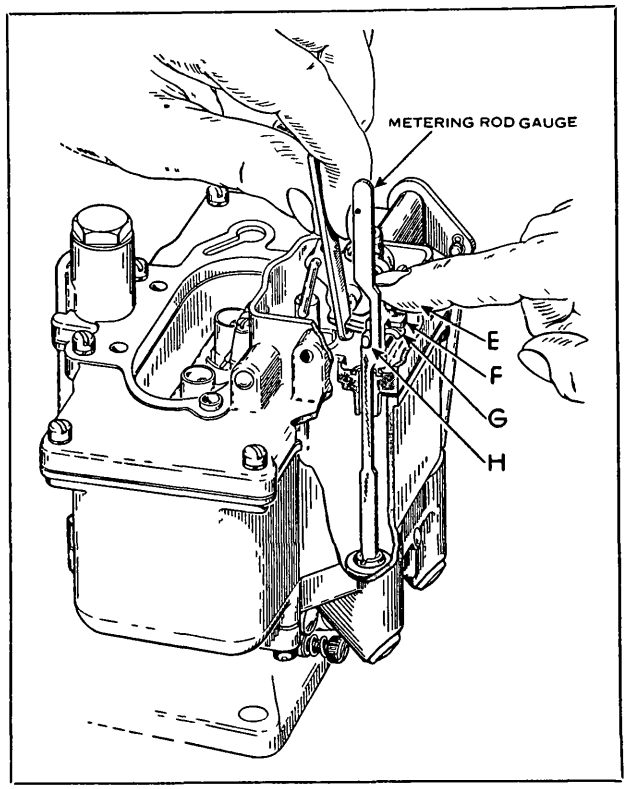

Figure 4

FAST IDLE ADJUSTMENT (Fig 5) With choke valve tightly closed, tighten fast idle adjusting screw (J) until there is 026" (K) opening between throttle valve and bore of carbureter side opposite port Use gauge T109-189 Be sure fast idle adjusting screw is on high step of cam (L) when making this setting

UNLOADER ADJUSTMENT. (Fig 6) Two adjustments are necessary

A Loosen choke lever clamp screw (M) on choke shaft Insert 040" feeler gauge T109 193 between lip of fast idle cam and boss on flange casting (N) Hold choke valve tightly closed and take all slack out of linkage by pressing choke lever toward closed position—hold in place tighten clamp screw (M)

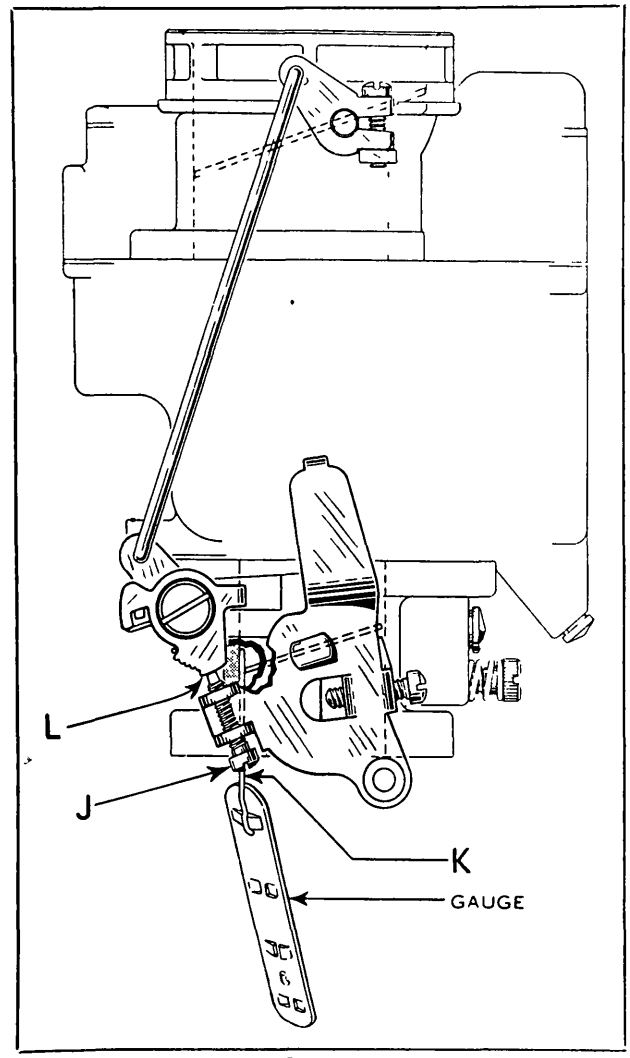

Figure 5

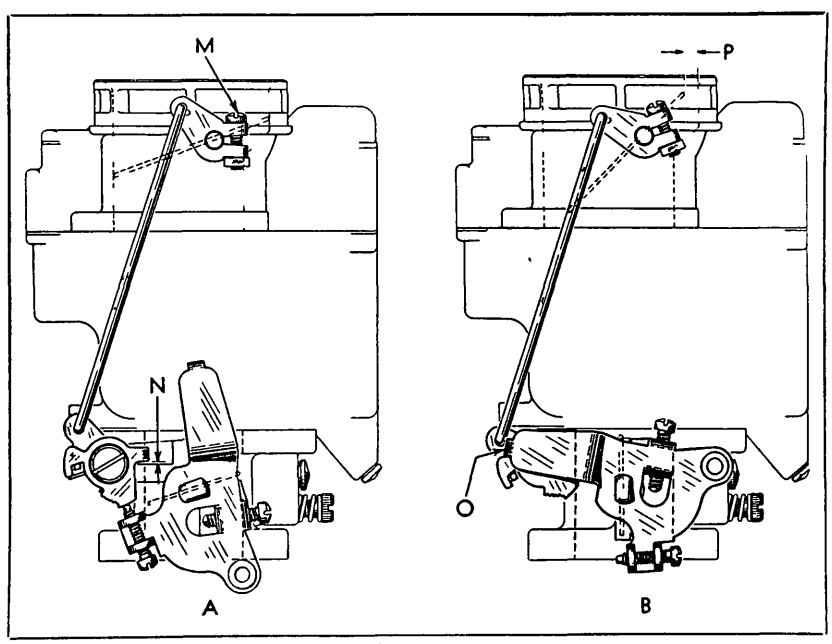
B Adjust unloader lip (O) on throttle shaft lever until there is 1/8" clearance between upper edge of choke valve and inner wall of air horn (P) **with throttle held in wide open position** (use gauge T109 36)



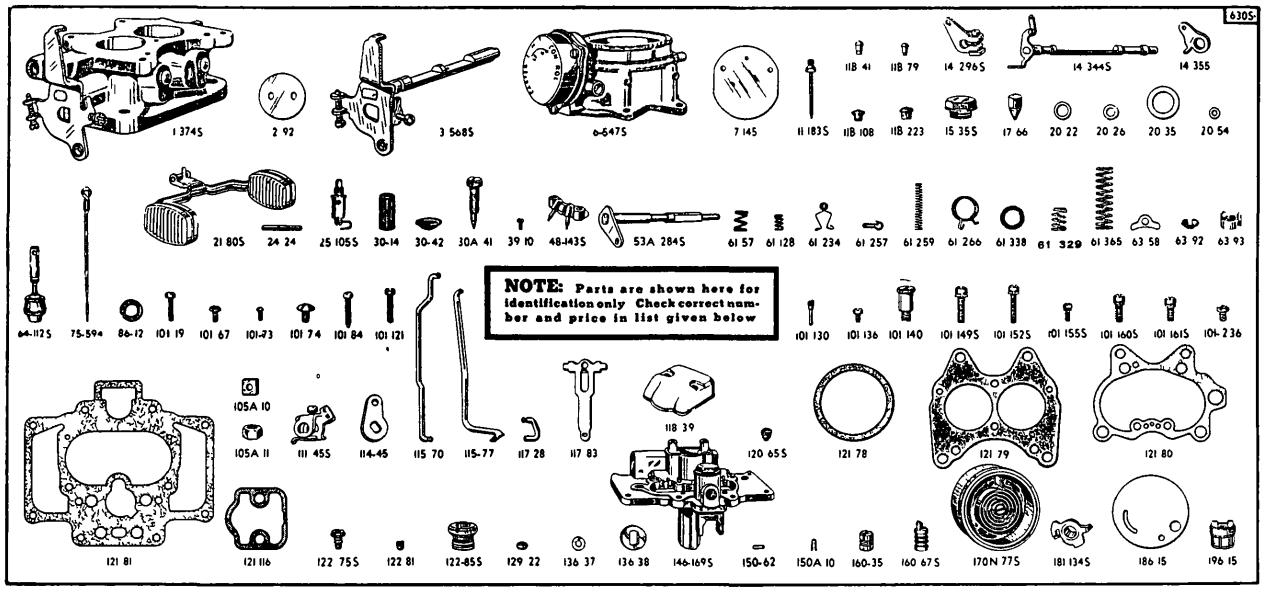


Figure 6

FLANGE ASSEMBLY The throttle centering screw 101 130 has been removed from flange 1 551S used on 630SA 630SB Throttle shaft and lever assembly 3 598S must be used with this flange as shaft is not grooved for the throttle centering screw but has additional length to accommodate throttle shaft retaining ring 63 118

To assemble flange 1 374S (with throttle centering screw) install throttle shaft and lever assembly and throttle centering screw then install throttle valves with c in circle **toward the idle port** when viewing the carbureter from the manifold side Center valves by tapping lightly and holding in place with fingers **before** tightening screws Always use new screws

To assemble flange 1 551S (without centering screw), install throttle shaft and turn to closed throttle position Push retaining ring **with prongs extending outward,** over end of throttle shaft until it is against casting (no end play in shaft). Throttle valves should then be installed centering them as mentioned above with throttle lever in closed position and throttle lever set screw backed out

BRIEF CARBURETER ADJUSTMENTS

PUMP ADJUSTMENT With pump connector link in lower hole in pump arm and throttle adjustment screw backed out pump plunger should travel 19/64" from closed to wide open position Adjustment can be made by bending throttle connector rod at lower angle (Use tool T109-75) Pump travel can be measured by using gauge T-109-117S Difference between reading at wide open and seated throttle should be 19 Projecting portion of indicator should be placed on top surface of connector link at pump shaft

METERING ROD ADJUSTMENT (A) Insert two metering rod gauges in place of metering rods **Use gauge No T109-27** Be sure gauges seat in metering rod jets after backing out throttle lever adjusting screw so that throttle valves seat

(B) Install metering rod pin and pin spring in metering rod arm

(C) Rest screwdriver lightly on metering rod arm until metering rod pin rests on shoulder of notches in both gauges A slight bend in metering arm may be necessary to equalize There may be less than 005" clearance between metering rod pin and gauges

(D) With throttle valves seated and metering rod pin resting lightly on notches in gauges tighten anti percolator arm screw

(E) Remove gauges and metering rod pin and install metering rods disks metering rod spring pin and pin spring and hook metering spring on metering rods

ANTI PERCOLATOR ADJUSTMENT This adjustment must be made after pump and metering rod adjustments have been made Do not disturb these adjustments Back out throttle

lever adjusting screw so that throttle valves seat in bores of carbureter
(540S) With throttle valves seated, bend lips on anti-percolator arm so that center of indicator line is just flush with top of anti-percolator plugs
(548S) With throttle valves seated, insert .015" flat feeler gauge (T109-72) between anti-percolator arm and anti-percolator valve stem Bend lips so that center of indicator line is flush with top of anti-percolator plug Arms must contact Crowns of anti-percolator stems
Since there are two anti-percolators on these carbureters, care must be taken so that there is an even adjustment on both anti-percolator arm lips

UNLOADER ADJUSTMENT With throttle wide open distance between upper edge of choke valve and inner wall of air horn should be 3/16" Adjustment can be made by bending lip on fast idle connector link If unloader is adjusted properly, with throttle wide open, move choke valve wide open and choke valve will be locked in wide open position Closing the throttle will release choke valve Choke trip lever is notched out for this setting

FAST IDLE ADJUSTMENT Hold choke valve tightly closed and adjust fast idle arm screw to give .026" opening between edge of throttle valve and bore of carbureter side opposite port (Use gauge No T109-189)

Pontiac 8—1942-46—Carbureter Nos. 540S-548S

WHEN SERVICING, USE GASKET ASSORTMENT No 134, REPAIR PKG. No 1086C (FOR 540S), No 1351C (FOR 548S)

WCD DUAL DOWN-DRAFT CLIMATIC® CONTROL **CARBURETER No. 2887S**

CARBURETER SPECIFICATIONS

For Rambler 6 Cylinder 196 Cu. In. Engine: Vacuum at Idle 18-20 Inches

Dimensions: Flange size 1 1/8 inch dual 4 bolt type
Primary venturi 11/32 inch I D
Secondary venturi 21/32 inch I D
Main venturi 1-1/16 inch I D

Vents: Inside, (in air horn) (1)
Outside (in dust cover) (1)

Low Speed Circuit. Jet size No 71 (.026 inch) drill
By pass size (.053 inch) diameter
Economizer size No 56 (.0465 inch) drill
Idle bleed size No 55 (.052 inch) drill
Idle port, (upper) length .120 inch width .030 inch

Idle Port Opening: .095 to .101 inch above upper edge of valve with valve closed tight

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter

Set Idle Adjustment Screw: 1/2 to 2 turns open For richer mixture turn screw out Do not idle engine below 475 r p m (Auto Trans.) in neutral 525 r p m (Std and Overdrive Trans.)

Main Nozzle: In primary venturi closed tip Nozzle is installed permanently Do not remove

Accelerating Pump Discharge jet (twin) size No 67 (.032 inch) drill
Intake ball check seat size .115 to .120 inch diameter
Discharge (needle seat) size No 50 (.070 inch) drill

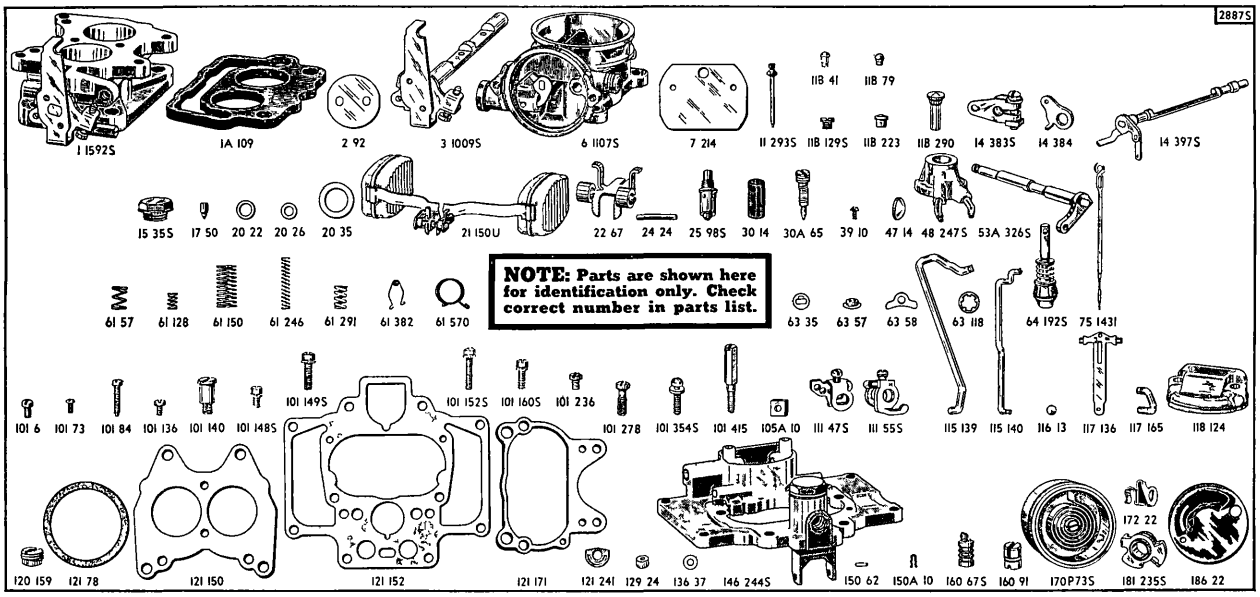
Choke Carter Climatic® Control set on index Offset butterfly type Choke heat suction hole in bowl cover Size No 36 (.1065 inch) drill

Vacuum Spark Port: Round type .040 inch diameter Top of port .028 to .038 inch above valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .020"	Ignition Timing Breaker Points to Open: 5° B. T. D. C. At Vibration Damper	Valve Setting (Hot) Intake .012" Exhaust .015"	Float Setting 5/32 Inch (Use Gauge T109-196)	Idle Adjustment Screw Setting 1/2 to 2 Auto. Trans. (In Neutral) 475 R.P.M. Std. & O'Drive 525 R.P.M.



CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical
LATERAL ADJUSTMENT With bowl cover assembly inverted, bowl cover gasket removed, place float gauge directly under floats with notched portions of gauge fitted over edges of casting Sides of floats should barely touch the vertical uprights of float gauge Adjustment should be made by bending arms of floats
VERTICAL ADJUSTMENT With float gauge in same position, floats should just clear the horizontal portion of gauge (Vertical distance between top of float and machined surface of casting must be 5/32 inch.) (Gauge T109-196.) Adjust by bending float arms Remove floats, install bowl cover gasket and then reinstall floats
PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending away from countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Be sure fast idle adjusting screw does not hold throttle open Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at upper angle Use tool T109-213
METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows 1 Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw 2 With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw
FAST IDLE ADJUSTMENT: Loosen choke lever clamp screw on choke shaft Insert .010 inch feeler gauge T109-200 between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw.
With choke valve tightly closed, tighten fast idle adjusting screw until there is .020 inch (gauge T109-29) opening between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment
UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (Use bending tool T109-41)

YF Down-Draft Climatic® Control **Carbureter No. 2757S**

CARBURETER SPECIFICATIONS

For Rambler 6 Cylinder Engine

Dimensions: Flange size, 1¼ inch S A E
Primary venturi 11/32 inch I D
Secondary venturi 11/16 inch I D
Main venturi 1¼ inch I D

Vents: Outside none Inside balance vent to air horn above choke valve

Low Speed Circuit: Jet size No 70 (.028 inch) drill
By pass in air horn size No 55 (.052 inch) drill
Economizer in body, size No 53 (.0595 inch) drill
Idle bleed, in body, size No 52 (.0635 inch) drill
Idle port slot type length .200 inch, width .030 inch

Idle Port Opening: Top of port .142 to .146 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): .0615 to .0655 inch diameter

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 450 r p m (Auto Trans—in neutral)

Main Nozzle: Nozzle is installed permanently DO NOT RE MOVE Anti percolator air bleed size No 70 (.028 inch) drill

Accelerating Pump: Diaphragm type vacuum and mechanically operated Discharge restriction (in housing) size No 65 (.035 inch) diameter Intake ball check seat (in diaphragm housing), size No 40 (.098 inch) drill Discharge ball check seat (in diaphragm housing) size No 32 (.116 inch) drill Vacuum restriction (in flange) size No 55 (.052 inch) drill Vacuum passage (diaphragm bleed) size No 65 (.035 inch) drill

Choke Carter Climatic® Control set one point lean offset butterfly type Choke heat suction hole in body size No 46 (.081 inch) drill

Vacuum Spark Port: Round type size .040 inch diameter Bottom of port .021 to .029 inch above top edge of valve with valve tightly closed

Transmission Vacuum Control Port: Round type, size .041 inch diameter Bottom of port .022 to .030 inch below lower edge of valve with valve tightly closed Bleed to cavity size No 58 (.042 inch) drill

Motor Tune-Up—Be Accurate!

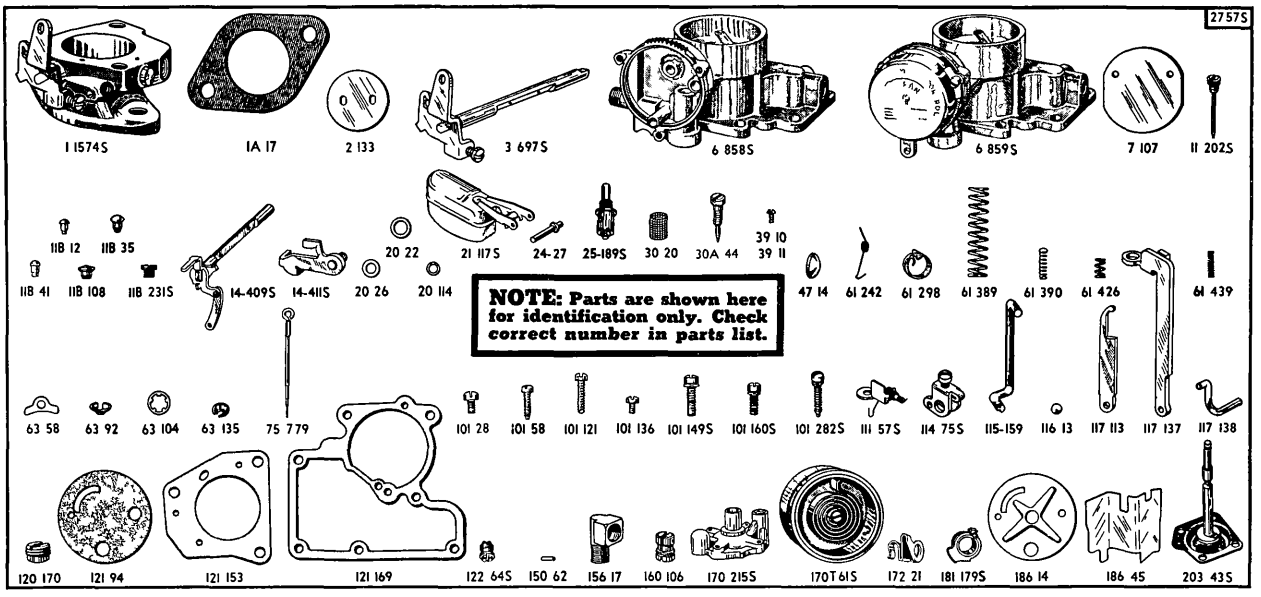
CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .030"	Breaker Point Setting .020"	Ignition Timing Breaker Points to Open: 4° A. T. D. C. At Vibration Damper	Valve Setting (Hot) Intake .015" Exhaust .015"	Float Setting ½ Inch (Use Gauge T109-83)	Idle Adjustment Screw Setting ½ to 1½ Auto. Trans. 450 R.P.M. In Neutral

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With gasket removed, bowl cover assembly inverted and float resting on seated needle, the distance from the bowl cover to the top of float at free end should be ½ inch (gauge T109 83) Adjust by bending lip of float, not float arm

METERING ROD ADJUSTMENT. This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed With throttle valve seated in bore of carbureter press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber Tool T109 212 may be used to hold diaphragm shaft down while adjusting metering rod Metering rod should contact bottom of metering rod well and metering rod arm should contact lifter link at the outer end nearest the springs and at supporting lug Adjust by bending lip of metering rod arm to which metering rod is attached up or down



ACCELERATING PUMP: If acceleration is not satisfactory remove pump housing intake check assembly and discharge check ball and spring Examine diaphragm for wear or damage Be sure intake screen intake check and discharge check are not clogged with lint or foreign matter Discharge check ball must

by ACF Industries, Incorporated
All Rights Reserved

seat as a leak at this point will result in poor acceleration Inspect and replace all worn parts clean and blow out all passages with compressed air

FAST IDLE ADJUSTMENT Remove thermostatic coil housing gasket and baffle plate Crack throttle valve and hold choke valve fully closed then close throttle This will allow fast idle cam to revolve to fast idle position With choke valve held tightly closed and throttle closed as far as possible there should now be 054 inch clearance (gauge T109 193) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending connector link at lower angle (Use bending tool T109 213)

UNLOADER ADJUSTMENT: This adjustment must be made after fast idle adjustment Hold throttle valve in wide open position and close choke valve as far as possible without forcing There should be 9/32 inch clearance between lower edge of choke valve and inner wall of air horn (gauge T109 126) Adjust by bending arm of choke trip lever (Use tool T109 214)

REED PRENTICE CORP.
POWER SAW
1951

HORIZONTAL, MODEL N TYPE, **CARBURETER No. N-850S**

CARBURETER SPECIFICATIONS

For Reed Prentice Power Saw 1 Cylinder (2 Cycle) Engine 2 Inch Bore, 2 Inch Stroke

Dimensions Flange size 1/2" S A E (Slotted)
Main Venturi size 1/2 inch

Float Level Distance from top of float (at free end) opposite needle seat to lower edge of float chamber cover when needle is seated to be 13/64 plus or minus 1/64 inch

Vents Inside—none Outside—No 50 (.070") drill

Gasoline Intake Square vertical needle seat size No 48 (.076") drill

Low Speed Jet Tube Jet size No 70 (.028") drill Auxiliary jet (idle bleed) 4—size No 70 (.028") drill

Idle Port .039 .042 inch diameter
Idle port opening—top of port to be .022 to .026 inch above upper edge of valve
Idle adjustment screw tapered

Set Idle Adjustment Screw 1 to 3 turns open For richer mixture turn screw out Do not idle engine below 1500 r p m

Main Nozzle Accelerating jets 4—No 55 (.052") drill in side of nozzle (in nozzle well)

Nozzle passage (nozzle well to air horn) restriction size No 35 (.110") drill

High Speed Adjusting Needle Seat (in base of nozzle) size .040 inch diameter

Setting See adjustments page two

Choke Manual—butterfly type

Spark Plug Gap .025"	Breaker Point Setting .018"	Ignition Timing Breaker Points to Open 25° B T D C	Float Setting 13/64" ± 1/64"	High Speed Adj Screw Setting 1 to 3 Turns Open	Idle Adjustment Screw Setting 1 to 3 Turns Open

SERVICE PROCEDURE

To Disassemble

1. Remove carbureter from engine
2. Remove bowl nut gasket and bowl
3. Remove float pin float needle and needle seat Check float for dents leaks and wear on float lip or in float pin holes
4. Remove bowl ring gasket
5. Remove low speed jet and high speed needle assembly and spring
6. Remove idle adjustment screw and spring
7. Remove nozzle
8. Remove throttle valve screws valve and shaft and lever assembly
9. Do not remove choke valve and shaft unless replacement of these parts is necessary A spring loaded ball retains choke in wide open position Be sure to use a new ball and spring when replacing choke shaft and lever assembly CAUTION Hold a screw driver handle or a small piece of wood over threaded hole in air horn (side opposite choke lever) to prevent the ball from flying out when shaft is removed
10. Clean all parts in clean gasoline or solvent making sure all carbon accumulation is removed from bore especially where throttle valve seats in casting Blow out all passages with compressed air Replace all worn or damaged parts Always use new gaskets

To Assemble

11. Install throttle shaft and valve Valve must be installed with trademark c on side toward idle port when viewing from flange side Always use new screws With valve screws loose and throttle lever set screw backed out seat valve by tapping lightly with a small screw driver Hold in place while tightening screws
12. Install nozzle making sure it seats in casting
13. Install needle seat needle float and float pin
14. Set float level With carbureter casting inverted float resting lightly against needle in its seat there should be 13/64" clearance (use gauge T109 39) between machine surface of casting and free end of float (side opposite needle seat) Adjust by bending lip of float with small screw driver
15. Install bowl ring gasket bowl bowl nut gasket and bowl nut Tighten securely after making sure bowl is centered in gasket
16. Install low speed jet and high speed needle assembly Turn in until it seats in nozzle then back out 2 turns
17. Then install idle adjusting screw finger tight Back out approximately 1 1/2 turns DO NOT USE PLIERS OR SCREW DRIVER AS IT MAY DAMAGE IDLE SCREW

REO TRUCK—1957

F-20 and F-120

GOLD COMET OA-255

WA1 Down-Draft Climatic® Control Carbureter No. 2542S

CARBURETER SPECIFICATIONS

For Reo 6 Cylinder 255 Cu. In. Engine

Dimensions: Flange size 1½ inch S A E
Primary venturi 11/32 inch I D
Secondary venturi, 11/16 inch I D
Main venturi 1-3/8 inch I D

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover, when needle is seated to be ½ inch

Vents: Outside No 10 (1935 inch) drill Inside none

Gasoline Intake: Square vertical needle Size No 46 (081 inch) drill hole in needle seat

Low Speed Jet Tube: Jet size No 64 (036 inch) drill By-pass in body size 063 inch diameter Economizer in body size No 52 (0635 inch) drill Idle bleed in body size No 52 (0635 inch) drill

Idle Port: Upper port slot type length 190 inch, width 040 inch

Idle Port Opening: 178 to 182 inch above valve with valve tightly closed

Idle Screw Seat: No 46 (084 inch) drill

Set Idle Adjustment Screw: 1¼ to 2¾ turns open For richer mixture turn screw out Do not idle engine below 500 r p m

Main Nozzle: Flush type (angle tip) seats in primary venturi at 45° angle

Metering Rod (Vacumeter Type): See Parts List for Size

Metering Rod Jet: 0995 inch diameter

Metering Rod Setting: Use gauge part No T109-102 (2 468 inches)

Accelerating Pump: Pressure type with adjustable stroke Discharge jet Size No 72 (025 inch) drill Intake ball check seat size No 60 (040 inch) drill Discharge ball check seat size No 32 (116 inch) drill Relief passage (to outside) size No 42 (0935 inch) drill

Choke: Carter Climatic® Control set 2 points lean—butterfly type offset valve Choke Heat Suction Hole in body size No 40 (098 inch) drill

Vacuum Spart Port: None

Motor Tune-Up — Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .025"	Breaker Point Setting .022"	Ignition Timing Breaker Points to Open: 8° B. T. C. At Fan Drive Pulley	Valve Setting (Hot) Intake .015" Exhaust .015"	Float Setting ½ Inch (Use Gauge T109-83)	Idle Adjustment Screw Setting 1¼ t 2¾ Turns Open Idle Engine at 500 R. P. M.

CARBURETER ADJUSTMENTS

Pump Adjustment: With throttle valve seated and connector link in upper hole (long stroke) pump plunger should travel 26/64" from closed to wide open throttle position Measure pump travel by using Universal pump travel gauge T109 117S Place base of the gauge on ridged portion of bowl cover so that projecting portion of pump gauge rests on top surface of connector link at pump shaft Hold gauge vertical The difference between the numbers shown by index mark on gauge at wide open and closed throttle position should be "26" (26/64") Adjust by bending throttle connector rod at lower angle

Metering Rod Adjustment: Correct setting of metering rod is important and must be made after pump adjustment or when leaner than standard rods are installed Insert gauge (tool T109-102) in place of metering rod, seating tapered end of gauge in metering rod jet Hold gauge vertical to insure seating in jet With throttle valve seated, press down on piston link directly over piston until it contacts the pump arm There should now be less than 005" clearance between metering rod pin and shoulder in notch of gauge Gauge must not drag on pin Adjust by bending lip on piston link (use tool T109 105) Remove gauge and install metering rod disc pin and spring

Anti-Percolator Adjustment: Crack throttle valve 016" by placing gauge T109 44 between throttle valve and bore of carbureter (side opposite idle port) Bend rocker arm (use tool T109 105) until there is a clearance of 010" between rocker arm lip and pump arm

Fast Idle Adjustment: With fast idle cam in normal idle position tighten throttle lever adjusting screw until it just seats against cam Hold throttle lever closed and pull cam back until first (or lower) step is against (not on) set screw There should now be 5/8" (T109-85) clearance between inside wall of air horn and lower edge of choke valve Adjust by bending fast idle link at offset portion (use tool T109-41)

Unloader Adjustment: With throttle valve wide open there should be 9/16" clearance (gauge T109-84) between lower edge of choke valve and inner wall of air horn Adjust by bending cam on throttle lever (T109 41)

CARBURETER
TRADE MARK REG U S. PAT. OFF.
MARCA REGISTRADA

S S PRINTED IN U.S.A.

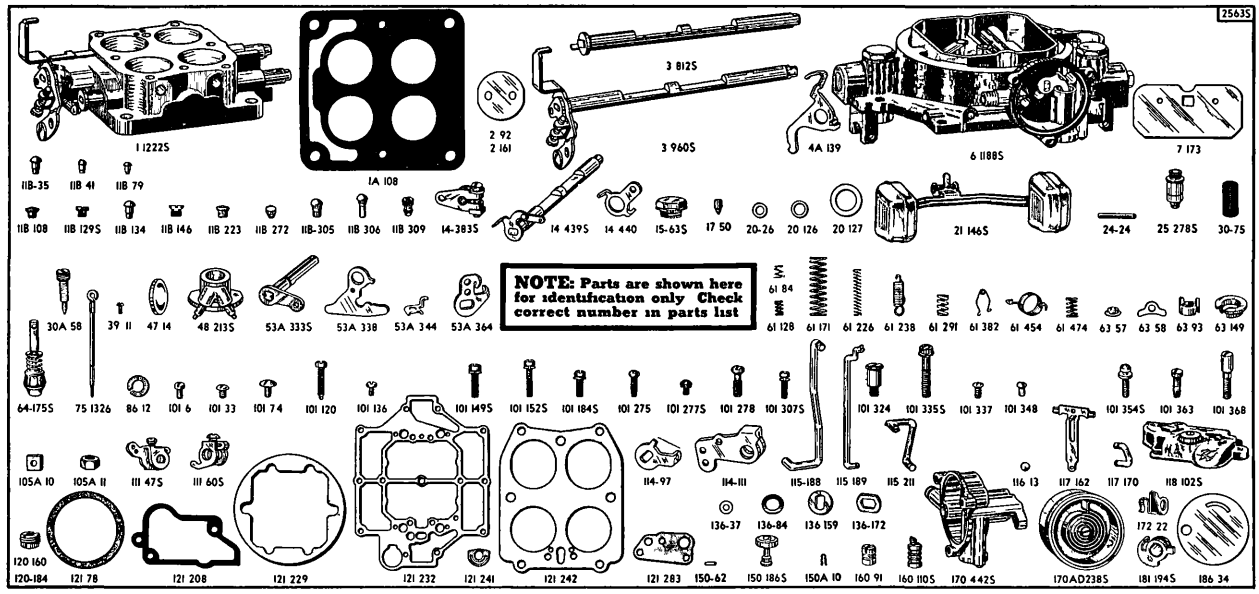
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge (T109-222) directly under floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 3/16 inch for both primary and secondary floats (gauge T109-222). Adjust by bending float arm.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 11/16 inch for both primary and secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: (1) Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. (2) With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. (3) Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.



BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .030 inch (gauge T109-29) opening between throttle valve and bore of carbureter, side opposite idle port. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle. (Use bending tool T109-213.) With primary and secondary throttle valves in tightly closed position there should be .017-.022 inch (gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

BBR2 DOWN-DRAFT CARBURETER—**No. 799S**

CARBURETER SPECIFICATIONS

For Reo Truck, 6 Cylinder Engine: 3⅝ Inch Bore, 4⅛ Inch Stroke

Dimensions: Flange size, 1½ inch.
Throttle bore, 1-11/16 inch.
Main venturi, 1-11/32 inch I. D.

Float Setting: Top of float 5/64 inch below top surface of carbureter body casting. Plus or minus 1/64 inch.

Vents: Outside none. Inside balance vent tube .218 inch diameter.

Gasoline Intake Needle: Triangular, horizontal No. 38 (.1015 inch) drill in needle seat.

Idle Orifice Tube: Jet size, .0276 inch (.70 mm) drill. Idle passage air bleed, in air horn, size .0465 inch diameter. Restriction in body, size .0452 inch diameter.

Idle Ports: Upper port. Slot type; length .149 inch, width .030 inch. Top of port located .118 to .122 inch above top edge of valve.
Lower port size .053 to .057 inch drill. (For idle adjustment screw.)

Set Idle Adjustment Screw: ¾ to 1¼ turns open. For richer mixture turn screw out. Do not idle engine below 450 r.p.m.

Main Metering Screw: Calibrated to flow 328 to 332 cc per minute. (Do not gauge for size. If in doubt replace with new part.)

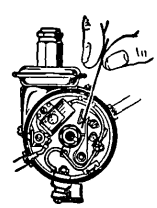
Main Vent: Through diffuser (air bleed inside bowl.) Size .0315 inch drill.

Vent Tube: Side Holes:
2—.0354 inch (.90 mm). Approximately 21/64 inch from end.
2—.0354 inch (.90 mm). Approximately 1-1/64 inches from end.

Step-Up Jet: Power orifice No. 63 (.037 inch) drill.

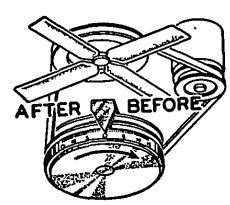
Accelerating Pump: Type—delayed action, seasonal adjustment. Stroke—Summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke). Pump intake passage ball check seat, size .107 to .112 inch diameter in body. Pump discharge passage: Restriction (under ball check) size .062 to .065 inch diameter in body. Pump (discharge) jet size, .0375 inch drill.

Pump Adjustment: 30/64 inch plunger travel—full throttle position, long stroke. Use gauge T109-117S.

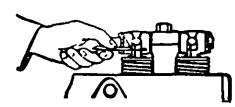


Choke: Offset butterfly type, with poppet valve.

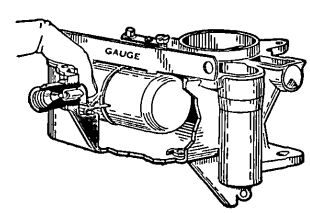
Motor Tune-Up—Be Accurate!



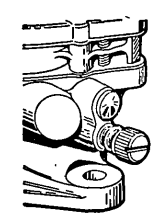
CAUTION: **Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.**



Spark Plug Gap .025"



Breaker Point Setting .022"



Ignition Timing Breaker Points to Open: 8° B.T.D.C. at 400 R.P.M. or below

Valve Setting Hot Intake .015" Exhaust .015"

Float Setting (Use Gauge) 5/64" ± 1/64"

Idle Adjustment Screw Setting ¾ to 1¼ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor does not idle below 450 r.p.m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube passages with compressed air.

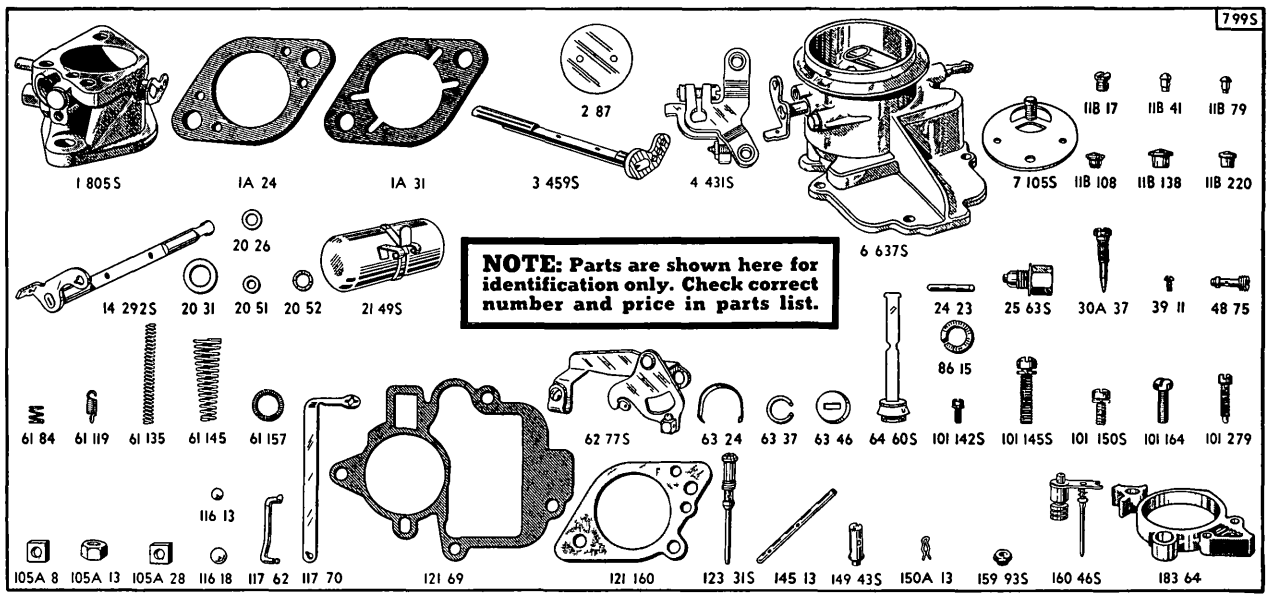
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.



If acceleration is not satisfactory, remove pump jet and clean with compressed air However, it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a "balance tube" in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with Tool No T109-43, main vent tube can be removed and a new tube inserted with Tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment. Remove air horn assembly, back out throttle adjustment screw, and place pump operating link in center hole of throttle shaft arm Place gauge T109-117S on edge of bowl cover so that lip of gauge extends over top of plunger shaft Turn knurled nut of gauge until lip contacts plunger shaft at closed and wide open throttle positions Difference in readings obtained at closed and wide open throttle positions should be 30 (30/64") plunger travel Adjustments can be made by bending horizontal portion of pump lifter link

Pump stroke adjustable for high or low temperature Set to long stroke for cold weather, short stroke for hot weather driving

Reo Carbureter No. 799S

SERVICE PROCEDURE

To Disassemble

1 Remove carbureter from engine
2 Remove bowl nut gasket and bowl
3 Remove float pin float needle and needle seat C float for dents leaks and wear on float lip or in floa holes
4 Remove bowl ring gasket
5 Remove low speed jet and high speed adjusting neec sembly and spring
6 Remove idle adjustment screw and spring
7 (N 2376S) Remove nozzle (N 2465S) Nozzle installe manently DO NOT REMOVE
8 Remove throttle valve screws valve and shaft and assembly
9 Do not remove choke valve and shaft unless replac of these parts is necessary A spring loaded ball choke in wide open position Be sure to use a ne and spring when replacing choke shaft and lever ass CAUTION Hold a screw driver handle or a small piece of wood over threaded hole in air horn (side opposite choke lever) to prevent the ball from flying out when shaft is removed
10 Clean all parts in clean solvent making sure all carbon accumulation is removed from bore especially where throttle valve seats in casting Blow out all passages with compressed air Replace all worn and damaged parts Always use new gaskets

To Assemble

11 Install throttle shaft and valve Valve must be installed with trademark c on side toward idle port when viewing from flange side Always use new screws With valve set screw backed out seat small screw driver Hold

CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

HIGH SPEED AND IDLE SCREW ADJUSTMENT

After rebuilding and installation on engine is complete the high speed and idle screw adjustments must be made With the high speed needle turned counter clockwise (from closed position) 1 turn and idle screw turned 1¾ turns open start engine

With the engine at normal operating temperature accelerate engine and check response The high speed needle should be adjusted for the leanest possible mixture which will allow satisfactory acceleration and steady governor operation If the engine misses and backfires the high speed mixture is too lean and the high speed adjustment screw must be turned counter clockwise ⅛ turn at a time to correct this condition If the engine loads (heavy exhaust) and is sluggish the mixture is too rich and the high speed adjustment screw must be turned clockwise ⅛ turn at a time to correct To make final check of the high speed adjustment operate the engine under load and adjust

The idle screw should be adjusted intermittently while making the high speed adjustment DO NOT USE FORCE ON THE HIGH SPEED NEEDLE OR IDLE SCREW AS DAMAGE MAY RESULT

Reo—Carbureters Nos. N-2376S, N-2465S

CARBURETER SPECIFICATIONS

For Reo 8 Cylinder Engine: 4 1/8 Inch Bore, 4 1/8 Inch Stroke (2220S)
For Reo 8 Cylinder Engine: 3 7/8 Inch Bore, 4 1/8 Inch Stroke (2265S)

Dimensions: Flange size, 1 1/8 inch Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 1-1/16 inch.
Main venturi (secondary) size, 15/16 inch I. D.

Float Level: See adjustments.

Vents: Outside, none. Inside, balance vent tube in air horn, 2 on primary side, 3 on secondary side.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only).
Jet, pressed in place (DO NOT REMOVE) size No. 68 (.031 inch) drill.
By pass, in body, size No. 52 (.0635 inch) drill.
Economizer, in screw plug, size No. 57 (.043 inch) drill.
Idle bleed, in body, size No. 52 (.0635 inch) drill.

Idle Port: (Upper) slot type. Primary, length .174 inch; width .040 inch. Secondary, none.

Idle Port Opening: Primary, .113 to .119 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary, none.

Set Idle Adjustment Screw: (2220S) 1 1/2 to 2 1/2, (2265S) 3/4 to 1 3/4, turns open. For richer mixture turn screw out. Do not idle engine below 500 r.p.m.

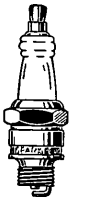
Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet (off nozzle well), size No. 60 (.040 inch) drill.

Metering Rod: Primary, economy step .071 inch diameter. Middle step tapers to .066 inch diameter. Power step .051 inch diameter. Secondary, none.

Metering Rod Jet: Primary, size .096 inch diameter (for metering rod). Secondary, size .0492 inch diameter (no metering rod).

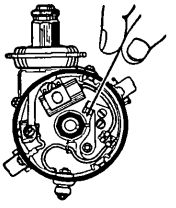
Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 74 (.0225 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.



Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set on index. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 43 (.089 inch) drill.



Vacuum Spark Port: None.

CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

S 8 PRINTED IN U.S.A.

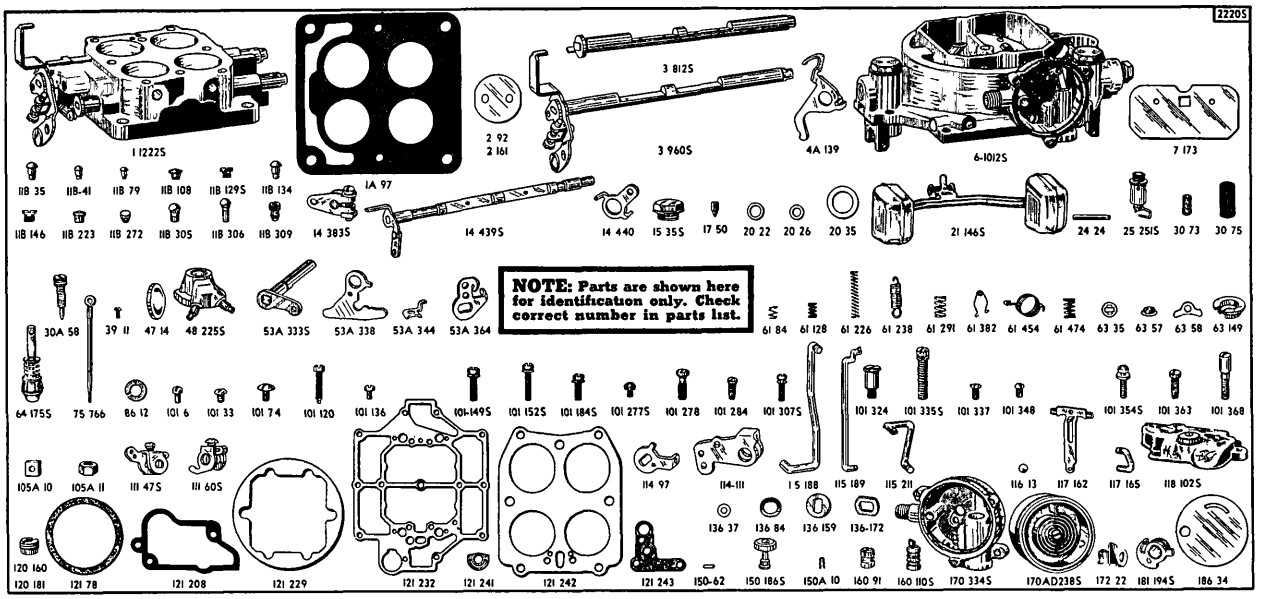
CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. **LATERAL ADJUSTMENT:** With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge (T109-222) directly under floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. **VERTICAL ADJUSTMENT:** With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 3/16 inch for both primary and secondary floats (gauge T109-222). Adjust by bending float arm.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 11/16 inch for both primary and secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: (1) Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. (2) With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. (3) Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.



BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .030 inch (gauge T109-29) opening between throttle valve and bore of carbureter, side opposite idle port. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 3/16 inch (gauge T109-28) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle. (Use bending tool T109-213.) With primary and secondary throttle valves in tightly closed position there should be .017-.022 inch (gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

SERVICE PROCEDURE

To Disassemble

1 Remove carbureter from engine
2 Remove bowl nut gasket and bowl
3 Remove float pin, float needle and needle seat Check float for dents leaks and wear on float lip or in float pin holes
4 Remove bowl ring gasket
5 Remove low speed jet and high speed adjusting needle assembly and spring
6 Remove idle adjustment screw and spring
7 (N 2026S) Remove nozzle (N 2475S) Nozzle installed permanently DO NOT REMOVE
8 Remove throttle valve screws valve and shaft and lever assembly
9 Do not remove choke valve and shaft unless replacement of these parts is necessary A spring loaded ball retains choke in wide open position Be sure to use a new ball and spring when replacing choke shaft and lever assembly CAUTION Hold a screw driver handle or a small piece of wood over threaded hole in air horn (side opposite choke lever) to prevent the ball from flying out when shaft is removed
10 Clean all parts in clean solvent making sure all carbon accumulation is removed from bore especially where throttle valve seats in casting Blow out all passages with compressed air Replace all worn and damaged parts Always use new gaskets

To Assemble

11 Install throttle shaft and valve Valve must be installed with trademark c on side toward idle port when viewing from flange side Always use new screws With valve screws loose and throttle lever set screw backed out seat valve by tapping lightly with a small screw driver Hold in place while tightening screws
12 (N 2026S) Install nozzle making sure it seats in casting
13 Install needle seat needle float and float pin
14 Set float level With carbureter casting inverted float resting lightly against needle in its seat there should be (N 2026S) 11/64 (N 2475S) 13/64 clearance between outer edge of casting and free end of float (side opposite needle seat) Adjust by bending lip of float with small screw driver
15 Install bowl ring gasket bowl bowl nut gasket and bowl nut Tighten securely after making sure bowl is centered in gasket
16 Install low speed jet and high speed needle assembly Turn in until it seats in nozzle then back out 1½ turns
17 Then install idle adjusting screw finger tight Back out approximately 1½ turns DO NOT USE PLIERS OR SCREW DRIVER AS IT MAY DAMAGE IDLE SCREW

HIGH SPEED AND IDLE SCREW ADJUSTMENT

After rebuilding and installation on engine is complete the high speed and idle screw adjustments must be made With the high speed needle turned counter clockwise (from closed position) 1½ turns and idle screw turned 1½ turns open start engine

With the engine at normal operating temperature accelerate engine and check response The high speed needle should be adjusted for the leanest possible mixture which will allow satisfactory acceleration and steady governor operation If the engine misses and backfires the high speed mixture is too lean and the high speed adjustment screw must be turned counter clockwise ⅛ turn at a time to correct this condition If the engine loads (heavy exhaust) and is sluggish, the mixture is too rich and the high speed adjustment screw must be turned clockwise ⅛ turn at a time to correct To make final check of the high speed adjustment operate the engine under load and adjust

The idle screw should be adjusted intermittently while making the high speed adjustment The final idle adjustment should be made at a speed not less than 1500 rpm DO NOT USE FORCE ON THE HIGH SPEED NEEDLE OR IDLE SCREW AS DAMAGE MAY RESULT

SERVICE PROCEDURE

To Disassemble

1 Remove carbureter from engine
2 Remove bowl nut gasket and bowl
3 Remove float pin float needle and needle seat Check float for dents leaks and wear on float lip or in float pin holes
4 Remove bowl ring gasket
5 Remove low speed jet and high speed adjusting needle assembly and spring
6 Remove idle adjustment screw and spring
7 Remove nozzle
8 Remove throttle valve screws valve and shaft and lever assembly
9 Do not remove choke valve and shaft unless replacement of these parts is necessary A spring loaded ball retains choke in wide open position Be sure to use a new ball and spring when replacing choke shaft and lever assembly CAUTION Hold a screw driver handle or a small piece of wood over threaded hole in air horn (side opposite choke lever) to prevent the ball from flying out when shaft is removed
10 Clean all parts in clean solvent making sure all carbon accumulation is removed from bore especially where throttle valve seats in casting Blow out all passages with compressed air Replace all worn and damaged parts Always use new gaskets

To Assemble

11 Install throttle shaft and valve Valve must be installed with trademark c on side toward idle port when viewing from flange side Always use new screws With valve screws loose and throttle lever set screw backed out seat valve by tapping lightly with a small screw driver Hold in place while tightening screws
12 Install nozzle making sure it seats in casting
13 Install needle seat needle float and float pin
14 Set float level With carbureter casting inverted float resting lightly against needle in its seat there should be 11/64" clearance between outer edge of casting and free end of float (side opposite needle seat) Adjust by bending lip of float with small screw driver
15 Install bowl ring gasket bowl bowl nut gasket and bowl nut Tighten securely after making sure bowl is centered in gasket
16 Install low speed jet and high speed needle assembly Turn in until it seats in nozzle then back out 1 turn
17 Then install idle adjusting screw finger tight Back out approximately 1½ turns DO NOT USE PLIERS OR SCREW DRIVER AS IT MAY DAMAGE IDLE SCREW

HIGH SPEED AND IDLE SCREW ADJUSTMENT

After rebuilding and installation on engine is complete the high speed and idle screw adjustments must be made With the high speed needle turned counter clockwise (from closed position) 1½ turns and idle screw turned 1 turn open start engine

With the engine at normal operating temperature accelerate engine and check response The high speed needle should be adjusted for the leanest possible mixture which will allow satisfactory acceleration and steady governor operation If the engine misses and backfires the high speed mixture is too lean and the high speed adjustment screw must be turned counter clockwise ⅛ turn at a time to correct this condition If the engine loads (heavy exhaust) and is sluggish the mixture is too rich and the high speed adjustment screw must be turned clockwise ⅛ turn at a time to correct To make final check of the high speed adjustment operate the engine under load and adjust

The idle screw should be adjusted intermittently while making the high speed adjustment DO NOT USE FORCE ON THE HIGH SPEED NEEDLE OR IDLE SCREW AS DAMAGE MAY RESULT

Reo Carbureters Nos. N-2206S, N-2228S

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed, the distance from the bowl cover to the top of float should be 9/32 inch (Gauge T109-126) Do not depress float lip against spring loaded pin in needle but let float rest of its own weight Adjust by bending lip of float, not float arm Float setting must be checked with the bowl cover held at eye height in a level position

FLOAT DROP With bowl cover assembly held in upright position the distance between free end of float and bowl cover should be 1¼ inch Adjust by bending stop tabs on float arm

PUMP ADJUSTMENT This adjustment should be made before the metering rod adjustment and should be checked each time the carbureter is reassembled With throttle valve seated in the bore of carbureter, press down on upper end of diaphragm shaft until it reaches its bottom position (tool T109-212 may be used to hold diaphragm shaft down while checking pump adjustment) The metering rod arm should now contact the pump lifter link at the outer end nearest the springs Adjust by bending pump connector link at its lower angle Use bending tool T109-213

CAUTION Bend connector rod only at its lower angle, as any other method may cause pump lifter link to bind

METERING ROD ADJUSTMENT This adjustment is important and should be checked each time the carbureter is reassembled With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod Metering rod should contact bottom of metering well and metering rod arm should contact lifter link between springs and at supporting lug Adjust by bending lip of metering rod arm to which metering rod is attached, up or down

CARBURETER SPECIFICATIONS

For Reo One (1) Cylinder Engine: 2 Inch Bore, 1 7/8 Inch Stroke
For Reo One (1) Cylinder Engine: 2 Inch Bore, 1 3/4 Inch Stroke

Dimensions: Flange size, 1/2 inch S. A. E. (slotted). Main venturi size, 13/32 inch.

Float Level: Distance from top of float (at free end) opposite needle seat to lower edge of float chamber cover when needle is seated to be 13/64 inch plus or minus 1/64 inch (use gauge T109-39).

Vents: Inside—none. Outside—No. 50 (.070") drill.

Gasoline Intake: Square vertical needle, seat size No. 48 (.076") drill.

Low Speed Jet Tube: Jet size No. 75 (.021") drill. Auxiliary jets: (idle bleed) in side of tube, 4 No. 70 (.028") drill.

Idle Port: Round type .027-.030 inch diameter. Idle port opening—Top of port to be .006-.010 inch above top edge of valve.

Idle adjustment screw seat, tapered 10° included angle, size .051 inch diameter at seat end.

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture, turn screw out. Do not idle engine below 1500 r.p.m. for lawnmowers and 900 r.p.m. for the Trollabout.

Main Nozzle: Accelerating jets 4—No. 55 (.052") drill in side of nozzle (in nozzle well). Nozzle passage: (nozzle well to air horn) No. 35 (.110") drill.

High Speed Adjusting Needle: Seat (in base of nozzle) size: .040 inch diameter. Setting, see "Adjustments", Page 2.

Choke: Manual—butterfly type.

SERVICE PROCEDURE

To Disassemble

1. Remove carbureter from engine.
2. Remove bowl nut, gasket and bowl.
3. Remove float pin, float, needle and needle seat. Check float for dents, leaks, and wear on float lip or in float pin holes.
4. Remove bowl ring gasket.
5. Remove low speed jet and high speed adjusting needle assembly and spring.
6. Remove idle adjustment screw and spring.
7. Remove nozzle.
8. Remove throttle valve screws, valve, and shaft and lever assembly.
9. Do not remove choke valve and shaft unless replacement of these parts is necessary. A spring loaded ball retains choke in wide open position. Be sure to use a new ball and spring when replacing choke shaft and lever assembly. CAUTION: Hold a screw driver handle or a small piece of wood over threaded hole in air horn (side opposite choke lever) to prevent the ball from flying out when shaft is removed.
10. Clean all parts in clean gasoline or solvent, making sure all carbon accumulation is removed from bore, especially where throttle valve seats in casting. Blow out all passages with compressed air. Replace all worn and damaged parts. Always use new gaskets.

To Assemble

11. Install throttle shaft and valve. Valve must be installed with trademark "c" on side toward idle port when viewing from flange side. Always use new screws. With valve screws loose and throttle lever set screw backed out, seat valve by tapping lightly with a small screw driver. Hold in place while tightening screws.
12. Install nozzle, making sure it seats in casting.
13. Install needle seat, needle, float and float pin.
14. Set float level. With carbureter casting inverted, float resting lightly against needle in its seat, there should be 13/64" clearance between machined surface of casting and free end of float (side opposite needle seat). Adjust by bending lip of float with small screw driver.
15. Install bowl ring gasket, bowl, bowl nut gasket and bowl nut. Tighten securely after making sure bowl is centered in gasket.
16. Install low speed jet and high speed needle assembly. Turn in until it seats in nozzle, then back out 1 1/2 turns.
17. Then install idle adjusting screw, finger tight. Back out approximately 1 1/2 turns. DO NOT USE PLIERS OR SCREW DRIVER AS IT MAY DAMAGE IDLE SCREW.

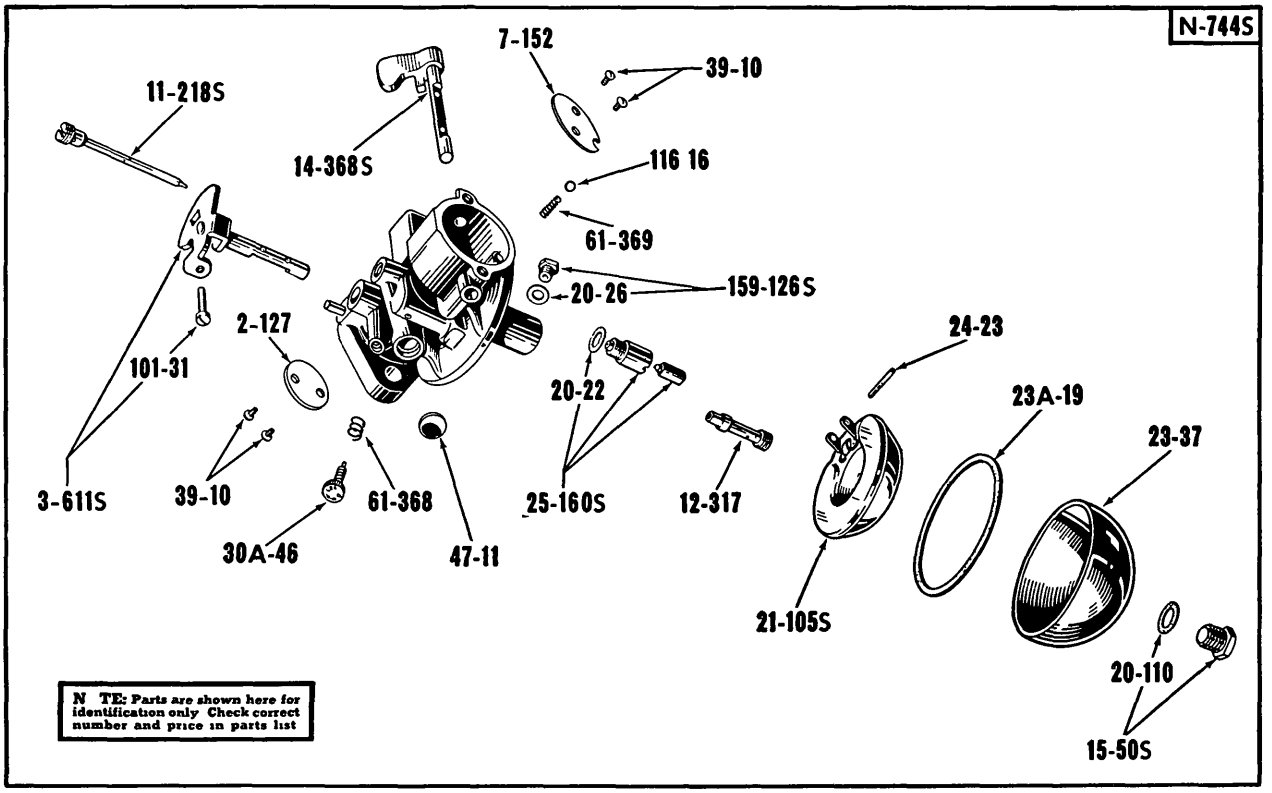
SERVICE PROCEDURE

To Disassemble

1. Remove carbureter from engine.
2. Remove bowl nut, gasket and bowl.
3. Remove float pin, float, needle and needle seat. Check float for dents, leaks, and wear on float lip or in float pin holes.
4. Remove bowl ring gasket.
5. Remove main metering jet assembly.
6. Remove low speed jet, idle adjusting screw and idle adjusting screw spring.
7. Remove nozzle.
8. Remove throttle valve screws, valve, and shaft and lever assembly.
9. Do not remove choke valve and shaft unless replacement of these parts is necessary. A spring loaded ball retains choke in wide open position. Be sure to use a new ball and spring when replacing choke shaft and lever assembly.
10. Clean all parts in clean gasoline or solvent, making sure all carbon accumulation is removed from bore, especially where throttle valve seats in casting. Blow out all passages with compressed air. **Do not attempt to remove welch plug at idle port.** Replace all worn and damaged parts. Always use new gaskets.



To Assemble

11. Install throttle shaft and valve. Valve must be installed with trademark "c" on side toward idle port when viewing from flange side. Always use new screws. With valve screws loose and throttle lever set screw backed out, seat valve by tapping lightly with a small screw driver. Hold in place while tightening screws.
12. Install nozzle, making sure it seats in casting.
13. Install main metering jet assembly.
14. Install needle seat, needle, float and float pin.
15. Set float level. With carbureter casting inverted, float resting lightly against needle in its seat, there should be 13/64" clearance between machined surface of casting and free end of float (side opposite needle seat). Adjust by bending lip of float with small screw driver. (Use gauge T109-39).
16. Install bowl ring gasket, bowl, bowl nut gasket and bowl nut. Tighten securely after making sure bowl is centered in gasket.
17. Install low speed jet, seating it securely in casting.
18. Then install idle adjusting screw, finger tight. Back out 1 to 3 turns. Do not use pliers or screw driver, as it may damage idle screw.

Do not idle engine below 1 500 r p m

Main Nozzle Discharge through 4—No 60 (.040") jets
Accelerating jets 4—No 62 (.038") drill in side of nozzle (in nozzle well)
Nozzle passage (nozzle well to air horn) No 35 (.110") drill

Main Metering Jet Calibrated to flow 43 to 45 c c per minute
Do not gauge for size If in doubt replace with new part

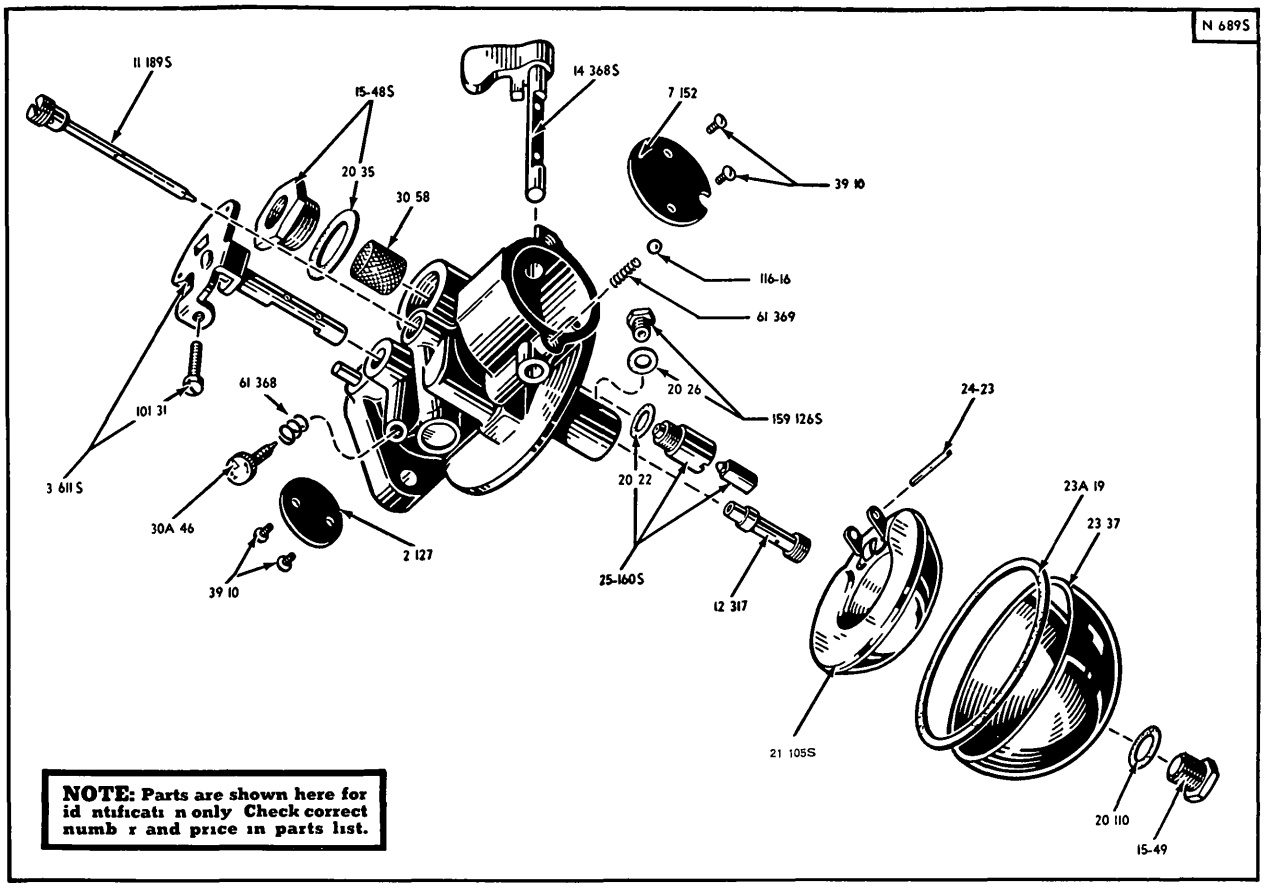
Choke Manual—butterfly type

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open	Valve Setting (Cold)	Float Setting	Idle Adjustment Screw Setting
.025"	.015" .018"	15° B T D C	Int .008"-.012" Exh .010" .014"	13/64"	1 to 3 Turns Open

SERVICE PROCEDURE

To Disassemble

1 Remove carbureter from engine
2 Remove bowl nut gasket and bowl
3 Remove float pin float needle and needle seat Check float for dents leaks and wear on float lip or in float pin holes
4 Remove bowl ring gasket
5 Remove main metering jet assembly
6 Remove low speed jet idle adjusting screw and idle adjusting screw spring
7 Remove strainer nut assembly and strainer
8 Remove nozzle
9 Remove throttle valve screws valve and shaft and lever assembly
10 Do not remove choke valve and shaft unless replacement of these parts is necessary A spring loaded ball retains choke in wide open position Be sure to use a new ball and spring when replacing choke shaft and lever asesmbly
11 Clean all parts in clean gasoline or solvent making sure all carbon accumulation is removed from bore especially where throttle valve seats in casting Blow out all passages with compressed air **Do not attempt to remove welch plug at idle port** Replace all worn and damaged parts Always use new gaskets



To Assemble

12 Install throttle shaft and valve Valve must be installed with trademark c on side toward idle port when viewing from flange side Always use new screws With valve screws loose and throttle lever set screw backed out seat valve by tapping lightly with a small screw driver Hold in place while tightening screws
13 Install nozzle making sure it seats in casting
14 Install main metering jet assembly
15 Install needle seat needle float and float pin
16 Set float level With carbureter casting inverted float resting lightly against needle in its seat there should be 13/64" clearance between machine surface of casting and free end of float (side opposite needle seat) Adjust by bending lip of float with small screw driver (Use gauge T109 39)
17 Install bowl ring gasket bowl bowl nut gasket and bowl nut Tighten securely after making sure bowl is centered in gasket
18 Install low speed jet seating it securely in casting
19 Install open end of strainer in strainer nut assembly and install strainer nut assembly
20 Then install idle adjusting screw finger tight Back out 1 to 3 turns **Do not use pliers or screw driver as it may damage idle screw**

Casting No. 571 on Face of Flange

REO MODEL "37" COACH 1948-1950

WCD Dual Down-Draft Climatic® Control Carbureter—**No. 657S**

CARBURETER SPECIFICATIONS

For Reo 6 Cylinder Engine: 4-5/16 Inch Bore, 4-7/8 Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 19/32 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: Distance from seam of float (both sides—at top center to lower edge of bowl cover, when needle is seated to be 3/16 inch. (Use gauge No. T109-162.)

Vents: Inside, balance vent tube .218 inch inside diameter. Outside, none.

Gasoline Intake: Square vertical (push-pull) needle. Size No. 42 drill in needle seat.

Low Speed Jet Tube: Jet size, No. 67 (.032") drill.
By-pass, size No. 56 (.0635") drill.
Economizer, size No. 63 (.037") drill.
Idle bleed, size No. 55 (.052") drill.

Idle Ports: Upper port, length .165 inch. Width .030 inch.

Idle Port Openings: .122 to .128 inch above upper edge of valve with valve closed tight.

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: 1 to 1½ turns open. For richer mixture turn screw out. Do not attempt to idle engine below 8 m. p. h.

Main Nozzle: In primary venturi, closed tip angle 49° from horizontal. Nozzle is installed permanently. **Do not remove.**

Metering Rod (Vacumeter Type): Economy step .068 inch diameter. Middle step tapers to .054 inch diameter. Power step .045 inch diameter. Length 3-41/64 inches.

Metering Rod Jet: .089 inch diameter.

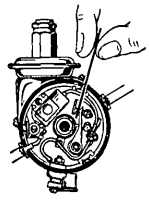
Metering Rod Setting: Use gauge, part No. T109-163 (2.940 inches).

Accelerating Pump: High pressure delayed action type. Adjustable stroke.

Discharge jet (twin) size, No. 68 (.031") drill.
Intake disk check size, No. 30 drill.
Discharge (needle seat) size, No. 55 drill.
Relief ball check size, No. 55 drill.

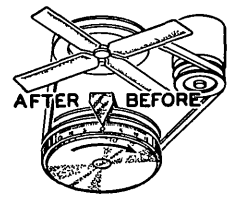
Pump Adjustment: "32" as indicated on gauge T109-117S with throttle valve seated or 17/64 inch from top of pump shaft to the top of the dust cover housing.

Choke: Carter Climatic® Control, set at center index point. Offset butterfly type. Choke heat suction hole, in bowl cover, size No. 32 drill.

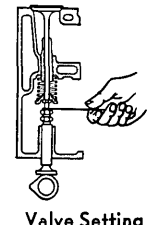


Vacuum Spark Port: None.

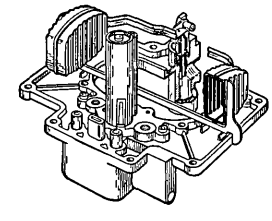
Motor Tune-Up—Be Accurate!



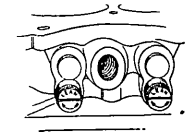
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .025"



Breaker Point Setting .018" - .024"



Ignition Timing Breaker Points to Open: 6° B.T.D.C.

Valve Setting (Hot) Intake .016" Exhaust .016"

Float Setting 3/16 Inch (Use Gauge T109-162)

Idle Adjustment Screw Setting 1 to 1½ Turns Open

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical.

LATERAL ADJUSTMENT: (Fig. 1) With bowl cover assembly inverted bowl cover gasket removed and float lip resting on seated needle, place float gauge T109-162 directly under float with notched portions of gauge fitted over edges of casting. Sides of floats should barely touch the vertical uprights of float gauge (A). Adjustments should be made by bending arms of floats.

VERTICAL ADJUSTMENT: (Fig. 1) With float gauge in position shown, floats should just clear the horizontal portion of gauge (B). Vertical distance between top of float and machined surface of casting must be 3/16". Adjust by bending float arms. Remove float, install bowl cover gasket and then reinstall float.

PUMP ADJUSTMENT: (Fig. 2) The accelerating pump has been designed to produce a uniform pump action. The total distance the plunger head (not shaft) moves from closed to wide open throttle controls the amount of fuel discharged. Correct pump travel is important and should be checked each time the carbureter is disassembled. Procedure is as follows:

Install pump connector link in lower hole (short stroke), with ends of link extending toward countershaft arm. Back out throttle

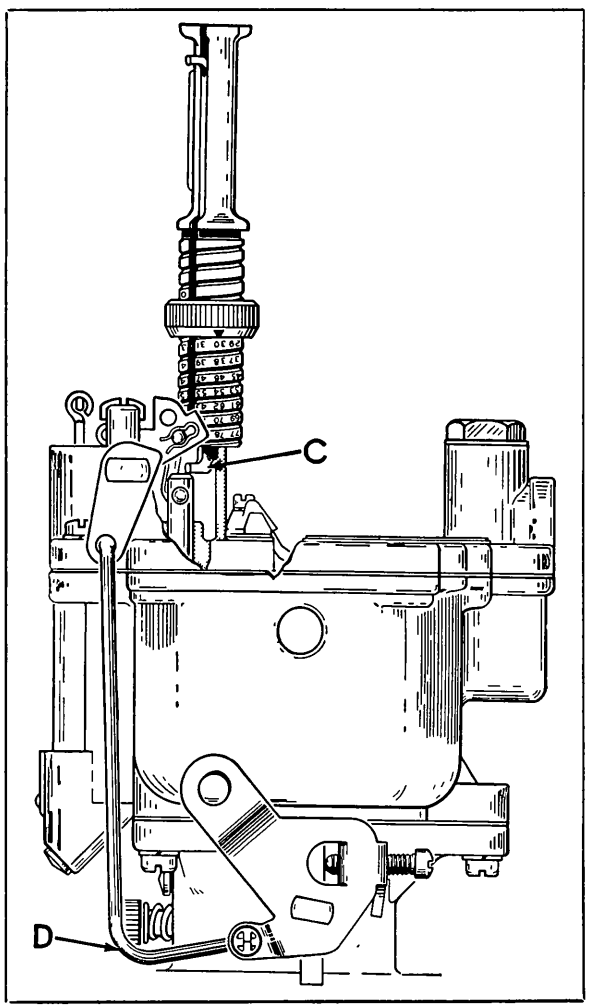

Figure 2

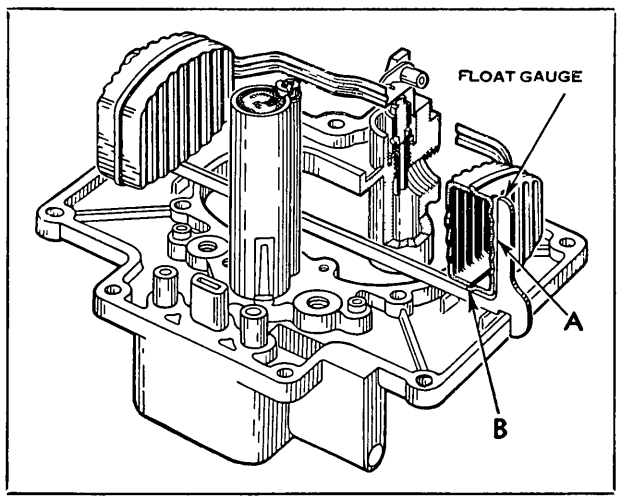

Figure 1

lever set screw to allow throttle valves to seat in bores of carbureter. Be sure fast idle adjusting screw does not hold throttle open. Place pump travel gauge T109-117S inverted on edge of dust cover boss of bowl cover as shown. Turn knurled nut of gauge until finger (C) just touches upper end of plunger shaft with throttle valves seated. Number indicated on gauge should be "32". Hold gauge vertical to insure correct reading.

Optional Adjustment: Top of pump plunger shaft should be 17/64" vertically below upper edge of dust cover boss on bowl cover, with throttle valves seated.

Adjust by bending throttle connector rod at lower angle (D).

PUMP JET ADJUSTMENT: (Fig. 3) Good acceleration performance at low speeds depends primarily on the gasoline discharged from the pump jets. Each of the two streams must be directed to its proper section of the dual venturi system. In order to obtain maximum efficiency each stream must be directed to a point between the primary and secondary venturi, missing the outer wall of the primary venturi but striking the lower part of the inner wall of the secondary venturi.

Only a slight bend should be necessary to properly aim the pump jets.

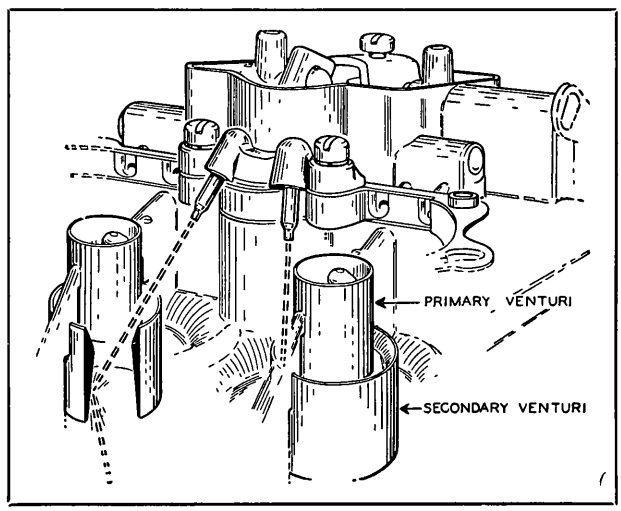

Figure 3

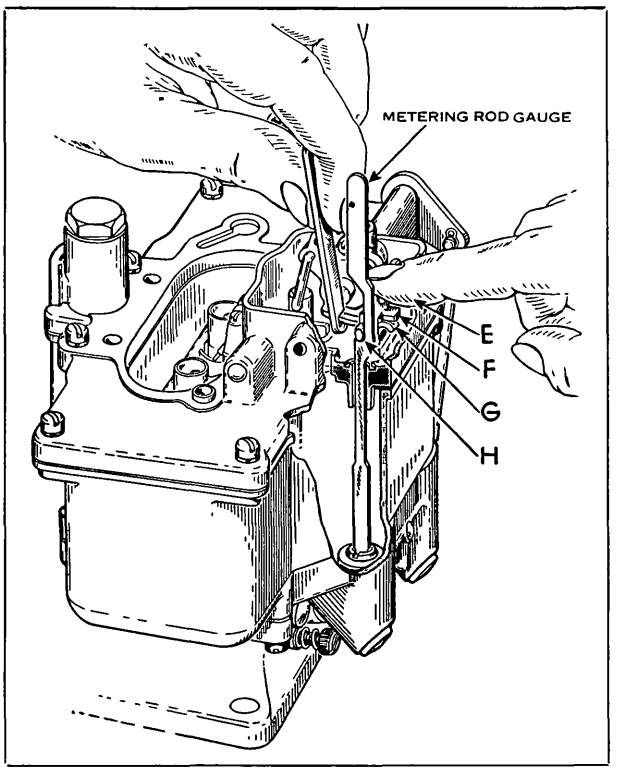

Figure 4

METERING ROD ADJUSTMENT: (Fig. 4) Back out throttle lever adjusting screw until throttle valves seat in bores of carbureter. Be sure fast idle adjusting screw does not hold throttle open. Insert one metering rod gauge T109-163 in place of either metering rod. Press down lightly on vacuum piston link (E) until lug of piston link (F) contacts lip of metering rod arm (G). There should be less than .005" clearance between metering rod bearing (H) and shoulder in notch of gauge. Adjustment should be made by bending lip of metering rod arm (G). Use bending tool T109-105.

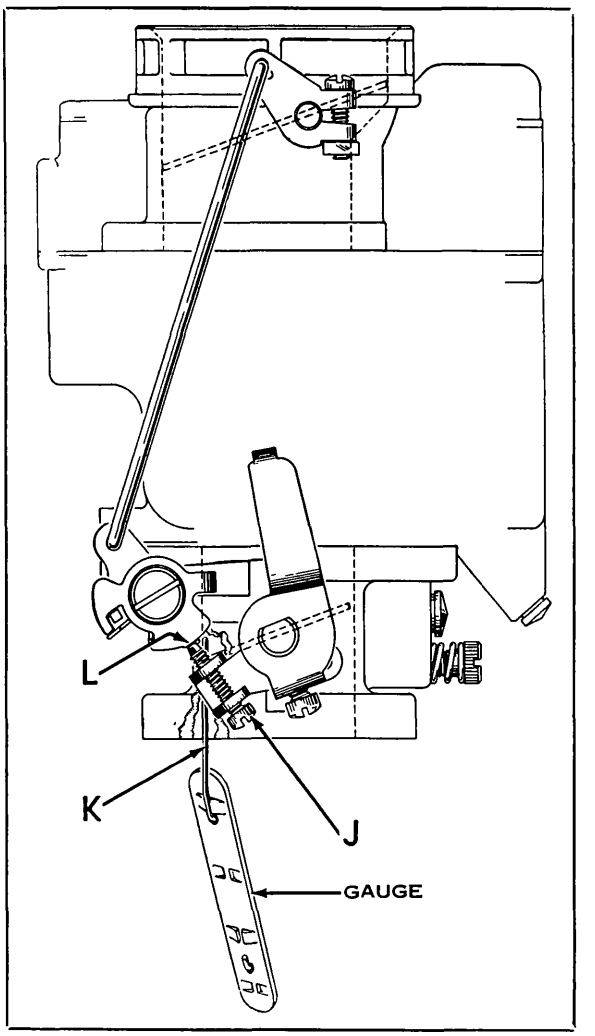

Figure 5

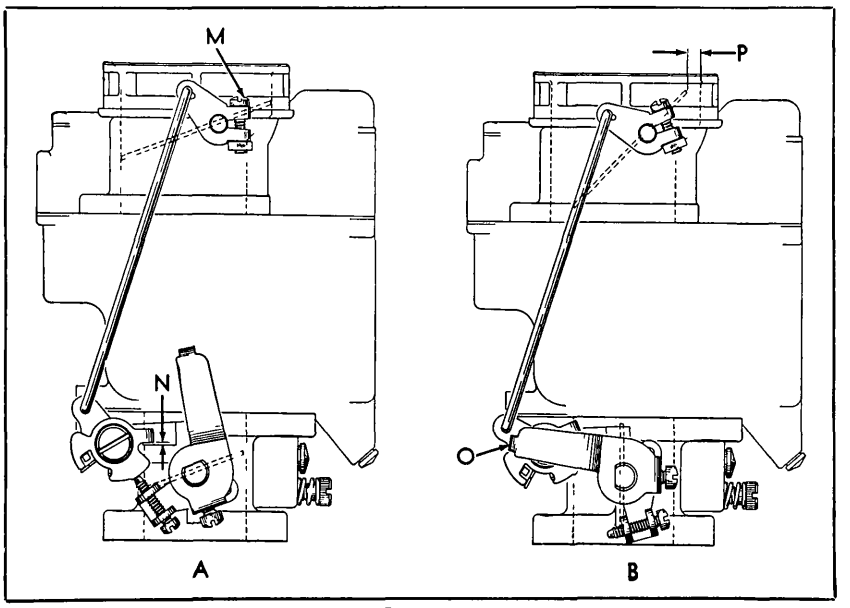
FAST IDLE ADJUSTMENT: (Fig. 5) With choke valve tightly closed, tighten fast idle adjusting screw (J) until there is .018" (K) opening between throttle valve and bore in carbureter, side opposite port. Use gauge T109-44. Be sure fast idle adjusting screw is on high step of cam (L) when making this setting.



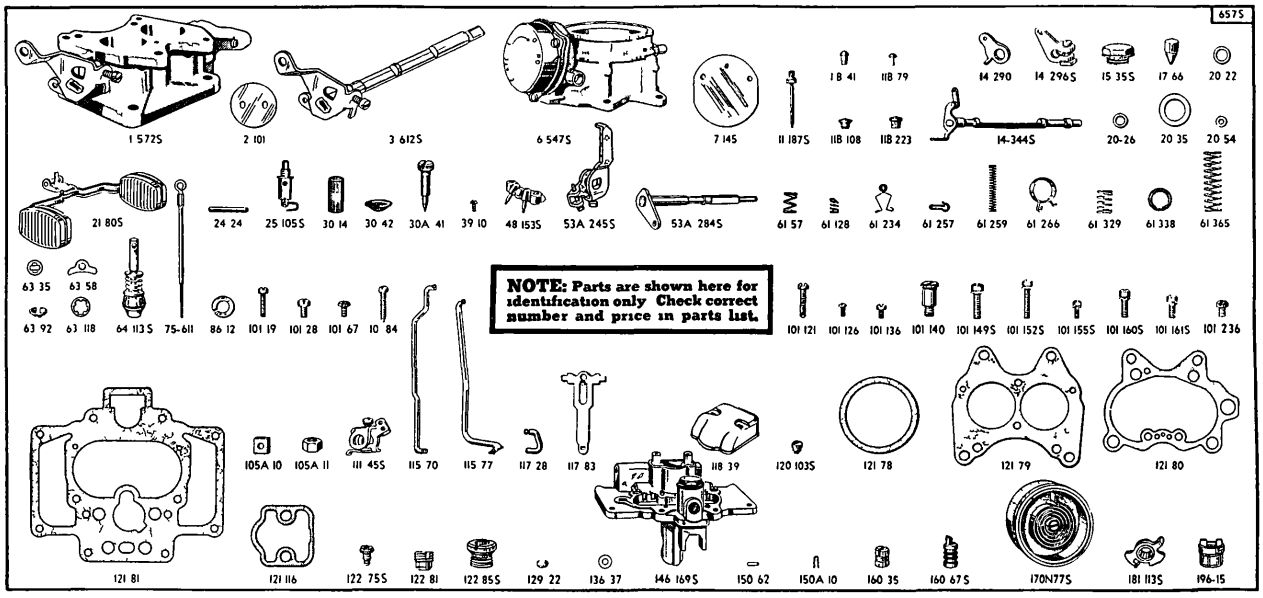


Figure 6

UNLOADER ADJUSTMENT: (Fig. 6) Two adjustments are necessary:

A. Loosen choke lever clamp screw (M) on choke shaft. Insert .010" feeler gauge T109-29 between lip of fast idle cam and boss on flange casting (N). Hold choke valve tightly closed and take all slack out of linkage by pressing choke lever toward closed position — hold in place — tighten clamp screw (M).

B. Adjust unloader lip (O) on throttle shaft lever until there is 3/16" clearance between upper edge of choke valve and inner wall of air horn (P) with throttle held in wide open position (Use gauge T109-28).

SERVICE PROCEDURE

CAUTION: REMOVE HIGH SPEED NEEDLE BEFORE REMOVING BOWL

To Disassemble

1 Remove carbureter from engine

2 Remove high speed adjusting needle, packing nut and packing (SCRIBE MARK ON BODY AND BOWL)

3 Remove bowl nut, gasket and bowl

4 Remove bowl drain spring spacer (if any) plug and gasket from inside of bowl

5 Remove float pin, float needle pin spring needle and needle seat Check float for dents leaks and wear on float lip or in float pin holes

6 Remove bowl ring gasket

7 Remove idle adjustment screw

8 Remove nozzle DO NOT REMOVE LOW SPEED JET TUBE

9 Remove throttle valve screws, valve and shaft and lever assembly

10 Clean all parts with solvent making sure all carbon accumulation is removed from bore especially where throttle valve seats in casting Blow out all passages with compressed air Replace all worn and damaged parts Always use new gaskets

To Assemble

11 Install throttle shaft and valve Valve must be installed with trademark C on side toward idle port when viewing from flange side Always use new screws With valve screws loose and throttle lever set screw backed out seat valve by tapping lightly with a small screwdriver Hold in place while tightening screws

12 Install nozzle making sure it seats in casting

13 Install needle seat needle needle spring pin float and float pin

14 Set float level with carbureter casting inverted float resting lightly against needle pin with needle seated There should be 11/64 inch clearance between outer surface of casting and free end of float (side opposite needle seat) Adjust by bending lip of float

15 Install bowl drain gasket plug spacer (if any) and spring in bottom of bowl When installing spring make sure the end fitting over drain plug points downward at a slight angle giving maximum tension on plug Place bowl nut and gasket through bottom of bowl to hold in place

16 Install bowl ring gasket and bowl (line up scribe marks) Tighten securely

17 Install high speed adjusting needle packing nut and new packing Turn needle in until it just seats in body then back out 3/4 turns

18 Install idle adjusting screw finger tight Back out approximately 3/4 turns Do not use pliers or screwdriver as it may damage idle screw

19 Install carbureter on engine and make idle and high speed adjustment as necessary

HIGH SPEED AND IDLE SCREW ADJUSTMENT

After rebuilding and installation on engine is complete the high speed and idle screw adjustments must be made

With the high speed needle turned counter clockwise (from closed position) ¾ turn and idle screw turned ¾ turns open start engine

With the engine at normal operating temperature accelerate engine and check response The high speed needle should be adjusted for the leanest possible mixture which will allow satis factory acceleration If the engine misses and backfires the high speed mixture is too lean and the high speed adjustment needle must be turned counter clockwise 1/10 turn at a time to correct this condition If the engine loads (heavy exhaust) and is slug gish the mixture is too rich and the high speed adjustment needle must be turned clockwise 1/10 turn at a time to correct To make final check of the high speed adjustments operate the engine under load and adjust

The idle screw should be adjusted intermittently while making the high speed adjustment DO NOT USE FORCE ON THE HIGH SPEED NEEDLE OR IDLE SCREW AS DAMAGE MAY RESULT

SERVICE PROCEDURE

CAUTION REMOVE HIGH SPEED NEEDLE BEFORE REMOVING BOWL

To Disassemble

1 Remove carbureter from engine

2 Remove high speed adjusting needle packing nut and packing (SCRIBE MARK ON BODY AND BOWL)

3 Remove bowl nut gasket and bowl

4 Remove float pin float spring needle and needle seat Check float for dents leaks and wear on float lip or in float pin holes

5 Remove bowl ring gasket

6 Remove idle adjustment screw and spring

7 Remove nozzle DO NOT REMOVE LOW SPEED JET TUBE

8 Remove throttle valve screws valve and shaft and lever assembly

9 Clean all parts with solvent making sure all carbon accumulation is removed from bore especially where throttle valve seats in casting Blow out all passages with compressed air Replace all worn and damaged parts Always use new gaskets

To Assemble

10 Install throttle shaft and valve Valve must be installed with trademark C on side toward idle port when viewing from flange side Alway use new screws With valve screws loose and throttle lever set screw backed out seat valve by tapping lightly with a small screwdriver Hold in place while tightening screws

11 Install nozzle making sure it seats in casting

12 Install needle seat spring needle float and float pin

13 Set float level with carbureter casting inverted float resting lightly against needle in its seat There should be 11/64 inch clearance between outer surface of casting and free end of float (side opposite needle seat) Adjust by bending lip of float

14 Install bowl ring gasket bowl (line up scribe marks) bowl nut gasket and bowl nut Tighten securely

15 Install high speed adjusting needle packing nut and new packing Turn needle in until it just seats in body then back out 1 turn

16 Install idle adjusting screw finger tight Back out approximately 1 1/4 turns Do not use pliers as it may damage idle screw

17 Install carbureter on engine and make idle and high speed adjustment as necessary

HIGH SPEED AND IDLE SCREW ADJUSTMENT

After rebuilding and installation on engine is complete the final high speed and idle screw adjustments must be made with the boat in the water Turning the adjustable main metering screw clockwise produces a leaner high speed mixture and turning the idle screw clockwise produces a leaner idle mixture With the high speed needle and idle screw turned approximately 1 turn open from closed position start the engine

With engine at normal operating temperature accelerate engine and check response For best performance—adjust each high speed needle for smoothest wide open performance then set slightly richer Check accelerations from idle and richen each mixture slightly for best acceleration All three adjusting screws are then fastened to the single control rod If the engine misses and backfires the high speed mixture is too lean If the engine loads (heavy exhaust) and is sluggish the mixture is too rich The idle screw should be adjusted intermittently while making the high speed adjustment

DO NOT USE FORCE ON THE HIGH SPEED NEEDLE OR IDLE SCREW AS DAMAGE MAY RESULT

SERVICE PROCEDURE

CAUTION: REMOVE HIGH SPEED NEEDLE BEFORE REMOVING BOWL

To Disassemble

1. Remove carbureter from engine.
2. Remove high speed adjusting needle, packing nut and packing (SCRIBE MARK ON BODY AND BOWL).
3. Remove bowl nut, gasket and bowl.
4. Remove float pin, float, needle and needle seat. Check float for dents, leaks and wear on float lip or float pin holes.
5. Remove bowl ring gasket.
6. Low speed jet assembly installed permanently. DO NOT REMOVE.
7. Remove idle adjustment screw and spring.
8. Nozzle installed permanently. DO NOT REMOVE.
9. Remove throttle valve screw, valve and shaft and lever assembly.
10. Do not remove choke valve and shaft unless replacement of these parts is necessary.
11. Clean all parts with solvent, making sure all carbon accumulation is removed from bore, especially where throttle valve seats in casting. Blow out all passages with compressed air. Replace all worn or damaged parts. Always use new gaskets.

To Assemble

12. Install throttle shaft and valve. Valve must be installed with trademark "C" on side toward idle port when viewing from flange side. Always use new screws. With valve screws loose, seat valve by tapping lightly with small screwdriver. Hold in place while tightening screws.
13. Install needle seat, needle, float and float pin.
14. Set float level with carbureter casting inverted, float resting lightly against needle in its seat. There should be 11/64 inch clearance between outer edge of casting and free end of float (side opposite needle seat). Adjust by bending lip of float.
15. Install high speed needle, packing nut and packing in bowl. Turn needle in until one thread on needle is visible at packing nut. Then install bowl ring gasket, bowl (line up scribe marks), bowl nut gasket and bowl nut. Tighten securely.
16. Turn high speed needle in until it just seats in body, then back out ¾ turn.
17. Install idle adjusting screw finger tight. Back out approximately ¾ turn. Do not use pliers or screwdriver as it may damage idle screw.
18. Install carbureter on engine and make idle and high speed adjustment as necessary.

HIGH SPEED AND IDLE SCREW ADJUSTMENT

After rebuilding and installation on engine is complete, the high speed and idle screw adjustments must be made.
With the high speed needle turned counter clockwise (from closed position) ¾ turn and idle screw turned ¾ turns open, start engine.

With the engine at normal operating temperature, accelerate engine and check response. The high speed needle should be adjusted for the leanest possible mixture which will allow satisfactory acceleration. If the engine misses and backfires, the high speed mixture is too lean and the high speed adjustment needle must be turned counter clockwise 1/10 turn at a time to correct this condition. If the engine loads (heavy exhaust) and is sluggish, the mixture is too rich and the high speed adjustment needle must be turned clockwise 1/10 turn at a time to correct. To make final check of the high speed adjustment, operate the engine under load and adjust.

The idle screw should be adjusted intermittently while making the high speed adjustment. DO NOT USE FORCE ON THE HIGH SPEED NEEDLE OR IDLE SCREW AS DAMAGE MAY RESULT.

SERVICE PROCEDURE

CAUTION: REMOVE HIGH SPEED NEEDLE BEFORE REMOVING BOWL

To Disassemble

1. Remove carbureter from engine.
2. Remove high speed adjusting needle, packing nut and packing. (SCRIBE MARK ON BODY AND BOWL.)
3. Remove bowl nut, gasket and bowl.
4. Remove bowl drain spring, spacer (if any), plug and gasket from inside of bowl.
5. Remove float pin, float, (No float spring) needle spring, needle and needle seat. Check float for dents, leaks and wear on float lip or in float pin holes.
6. Remove bowl ring gasket.
7. Remove idle adjustment screw.
8. Remove nozzle. DO NOT REMOVE LOW SPEED JET TUBE.
9. Remove throttle valve screws, valve and shaft and lever assembly.
10. Clean all parts with solvent, making sure all carbon accumulation is removed from bore, especially where throttle valve seats in casting. Blow out all passages with compressed air. Replace all worn and damaged parts. Always use new gaskets.

To Assemble

11. Install throttle shaft and valve. Valve must be installed with trademark "C" on side toward idle port when viewing from flange side. Always use new screws. With valve screws loose and throttle lever set screw backed out, seat valve by tapping lightly with a small screwdriver. Hold in place while tightening screws.
12. Install nozzle making sure it seats in casting.
13. Install needle seat, needle, needle spring, float and float pin.
14. Set float level with carbureter casting inverted, float resting lightly against needle spring with needle seated. There should be 11/64 inch clearance between outer surface of casting and free end of float (side opposite needle seat). Adjust by bending lip of float.
15. Install bowl drain gasket, plug, spacer (if any) and spring in bottom of bowl. When installing spring make sure the end fitting over drain plug points downward at a slight angle giving maximum tension on plug. Place bowl nut and gasket through bottom of bowl to hold in place.
16. Install bowl ring gasket and bowl (line up scribe marks). Tighten securely.
17. Install high speed adjusting needle, packing nut and new packing. Turn needle in until it just seats in body then back out 3/4 turns.
18. Install idle adjusting screw finger tight. Back out approximately 3/4 turns. Do not use pliers or screwdriver as it may damage idle screw.
19. Install carbureter on engine and make idle and high speed adjustment as necessary.

Choke: Manual—Butterfly type valve

MOTOR TUNE-UP

Spark Plug Gap	Breaker Point Setting	Float Setting	High Speed Adj. Screw Setting	Idle Adjustment Screw Setting
.035" (N-2678S, N-2763S) .030" (N-2679S)	.020"	11/64" ± 1/64"	¼ to 1½ Turns Open	¼ to 1¾ (N-2678S, N-2763S) ¼ to 1½ (N-2679S) Turns Open

SERVICE PROCEDURE

CAUTION: REMOVE HIGH SPEED NEEDLE BEFORE REMOVING BOWL

To Disassemble

1 Remove carbureter from engine

2 Remove high speed adjusting needle, packing nut and packing (SCRIBE MARK ON BODY AND BOWL)

3. Remove bowl nut gasket and bowl

4 Remove float pin float needle and needle seat Check float for dents leaks and wear on float lip or float pin holes

5 Remove bowl ring gasket

6 Low speed jet assembly installed permanently DO NOT REMOVE

7 Remove idle adjustment screw and spring

8 Nozzle installed permanently DO NOT REMOVE

9 Remove throttle valve screw, valve and shaft and lever assembly

10 Do not remove choke valve and shaft unless replacement of these parts is necessary

11 Clean all parts with solvent, making sure all carbon accumulation is removed from bore, especially where throttle valve seats in casting Blow out all passages with compressed air Replace all worn or damaged parts Always use new gaskets

To Assemble

12 Install throttle shaft and valve Valve must be installed with trademark "C" on side toward idle port when viewing from flange side Always use new screws With valve screws loose, seat valve by tapping lightly with small screwdriver. Hold in place while tightening screws

13 Install needle seat, needle, float and float pin

14 Set float level with carbureter casting inverted, float resting lightly against needle in its seat There should be 11/64 inch clearance between outer edge of casting and free end of float (side opposite needle seat). Adjust by bending lip of float

15 Install high speed needle, packing nut and packing in bowl Turn needle in until one thread on needle is visible at packing nut Then install bowl ring gasket, bowl (line up scribe marks) bowl nut gasket and bowl nut Tighten securely

16 Turn high speed needle in until it just seats in body then back out ¾ turn

17 Install idle adjusting screw finger tight Back out approximately ¾ turn Do not use pliers or screwdriver as it may damage idle screw

18 Install carbureter on engine and make idle and high speed adjustment as necessary

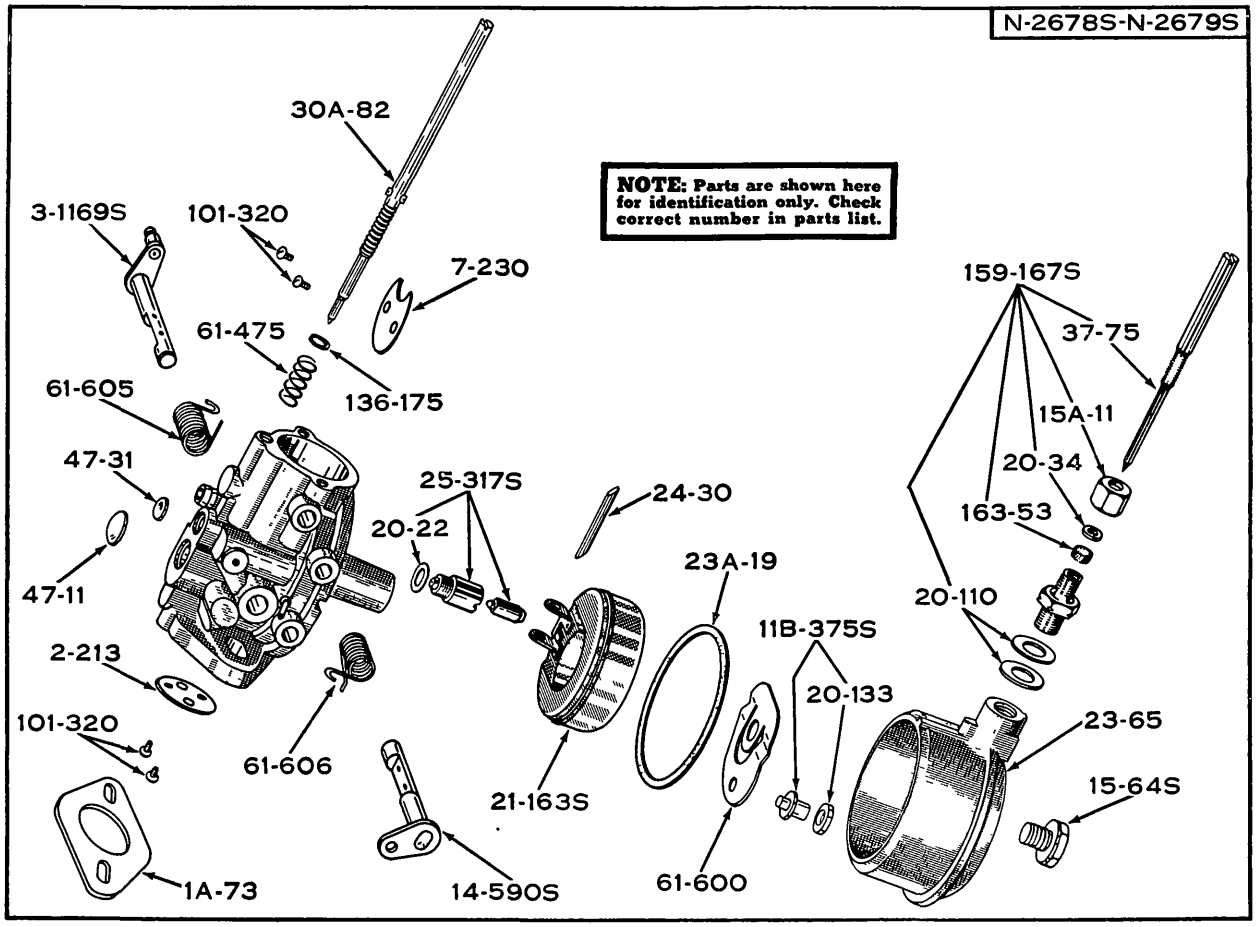
MARCA RE ISTRADA

S S PRINTED IN U S A



HIGH SPEED AND IDLE SCREW ADJUSTMENT

After rebuilding and installation on engine is complete, the high speed and idle screw adjustments must be made.

With the high speed needle turned counter clockwise (from closed position) ¾ turn and idle screw turned ¾ turns open, start engine.

With the engine at normal operating temperature, accelerate engine and check response. The high speed needle should be adjusted for the leanest possible mixture which will allow satisfactory acceleration. If the engine misses and backfires, the high speed mixture is too lean and the high speed adjustment needle must be turned counter clockwise 1/10 turn at a time to correct this condition. If the engine loads (heavy exhaust) and is sluggish, the mixture is too rich and the high speed adjustment needle must be turned clockwise 1/10 turn at a time to correct. To make final check of the high speed adjustment, operate the engine under load and adjust.

The idle screw should be adjusted intermittently while making the high speed adjustment. DO NOT USE FORCE ON THE HIGH SPEED NEEDLE OR IDLE SCREW AS DAMAGE MAY RESULT.

SENSATION MOWER 1948

Horizontal, Model N Type, **Carbureter No. N-697S**

CARBURETER SPECIFICATIONS

For Sensation Mower 1 Cylinder Engine: 2-1/16" Bore, 1⅝" Stroke

Dimensions: Flange Size: ½ inch S. A. E. · Main venturi size: 7/16 inch.

Float Level: Distance from top of float (at free end) opposite needle seat to lower edge of float chamber cover when needle is seated to be 13/64 inch.

Vents: Inside—none. Outside—No. 50 (.070") drill.

Gasoline Intake: Square vertical needle, seat size No. 48 (.076") drill.

Low Speed Jet Tube: Jet size No. 66 (.033") drill.
Auxiliary jets: in side of tube, 4 No. 70 (.028") drill.

Idle Port: Slot type, length .080 inch, width .030 inch.
Idle port opening—Bottom of port to be .0 to .004" above top edge of valve.
Idle adjustment screw seat, tapered 10° included angle. Size: .051" diameter at seat end.

Set Idle Adjustment Screw: 1 to 3 turns open. For richer mixture, turn screw out. Do not idle engine below 1,000 r.p.m.

Main Nozzle: Discharge: through 4—No. 60 (.040") jets.
Accelerating jets 4—No. 62 (.038") drill in side of nozzle, (in nozzle well).
Nozzle passage: (nozzle well to air horn) No. 35 (.110") drill.

Main Metering Jet: Calibrated to flow 65 to 67 c.c. per minute. Do not gauge for size. If in doubt, replace with new part.

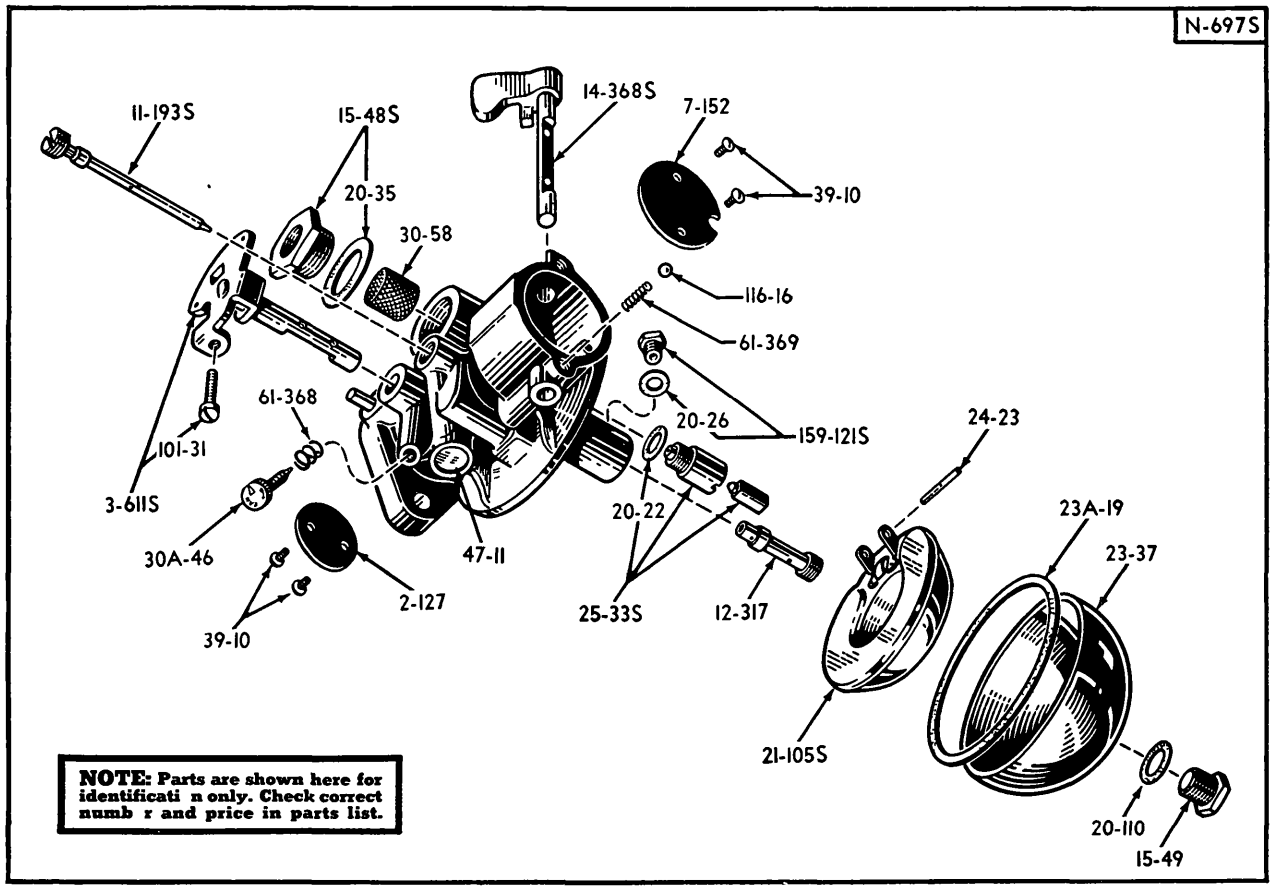
Choke: Manual—butterfly type.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open	Float Setting	Idle Adjustment Screw Setting
.020"	.020"	7° B. T. D. C.	13/64"	1 to 3 Turns Open

SERVICE PROCEDURE

To Disassemble

1. Remove carbureter from engine.
2. Remove bowl nut, gasket and bowl.
3. Remove float pin, float, needle and needle seat. Check float for dents, leaks, and wear on float lip or in float pin holes.
4. Remove bowl ring gasket.
5. Remove main metering jet and gasket assembly.
6. Remove low speed jet, idle adjusting screw and idle adjusting screw spring.
7. Remove strainer nut and gasket assembly and strainer.
8. Remove nozzle.
9. Remove throttle valve screws, valve, and shaft and lever assembly.
10. Do not remove choke valve and shaft unless replacement of these parts is necessary. A spring loaded ball retains choke in wide open position. Be sure to use a new ball and spring when replacing choke shaft and lever assembly.
11. Clean all parts in clean gasoline or solvent, making sure all carbon accumulation is removed from bore, especially where throttle valve seats in casting. Blow out all passages with compressed air. Replace all worn and damaged parts. Always use new gaskets.



To Assemble

12. Install throttle shaft and valve. Valve must be installed with trademark "c" on side toward idle port when viewing from flange side. Always use new screws. With valve screws loose and throttle lever set screw backed out, seat valve by tapping lightly with a small screw driver. Hold in place while tightening screws.
13. Install nozzle, making sure it seats in casting.
14. Install main metering jet and gasket assembly.
15. Install needle seat, needle, float and float pin.
16. Set float level. With carbureter casting inverted, float resting lightly against needle in its seat, there should be 13/64" clearance between machine surface of casting and free end of float (side opposite needle seat). Adjust by bending lip of float with small screw driver. (Use gauge T109-39).
17. Install bowl ring gasket, bowl nut gasket and bowl nut. Tighten securely after making sure bowl is centered in gasket.
18. Install low speed jet, seating it securely in casting.
19. Install open end of strainer in strainer nut and gasket assembly and install strainer nut assembly.
20. Then install idle adjusting screw, finger tight. Back out 1 to 3 turns. **Do not use pliers or screw driver, as it may damage idle screw.**

GENERAL BULLETIN

ALL CARBURETER ACCOUNTS

BULLETIN NO. 5 Studebaker

DATE March 18, 1959

SUBJECT: 1959 STUDEBAKER LARK 6 - CARTER AS-2876S CARBURETER

SLOW HOT ENGINE STARTING

Under conditions of high underhood temperatures combined with fuel having a relatively low boiling point, the engine may not start as quickly as under more normal conditions. The following changes will help improve starting under these conditions.

The 75-1444S metering rod has had milled flats added to the end of the economy step. The part number of the rod does not change when the flats are added. At closed throttle, the flats are positioned in the orifice of the jet and this provides a larger area for vapor to escape from the high speed passages.

A heat deflecting sheet metal shield installed between the carbureter and manifold has proven helpful. A gasket is used on each side of the shield. Longer carbureter attaching studs are necessary when installing the shield and additional gaskets. The thin metal baffle ring used between the carbureter and manifold is discarded when the heat shield is installed. The shield, studs and gaskets are Studebaker parts.

ROUGH HOT ENGINE IDLE AND STALLING

This condition is usually only found after high speed highway travel during unusually hot weather. In some cases it may appear that the carbureter is flooding. This condition may be relieved by drilling the second vent stack through from the bowl with a #24 drill. A #30 drill outside vent hole is then drilled into this stack 3/4" up from the bowl gasket surface. (See Illustration) A center point for the vent stack hole is cast into the underside of the bowl cover. A 5/32" diameter drill may be substituted for the #24 drill and a 1/8" diameter drill for the #30.

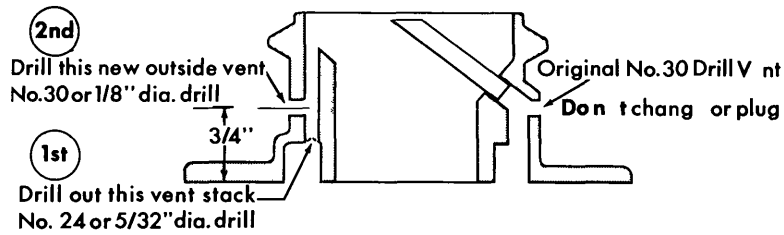

Illustration No. 1

THROTTLE LINKAGE STICKING

Examine the accelerator linkage on the engine and fire wall for excessive friction or binding in the bearing surfaces between the rods and levers. Pay particular attention to the alignment of the accelerator rod in the throttle lever on the carbureter.

Bend the levers slightly and lubricate sparingly, so the linkage operates f

A damaged or misaligned throttle valve or a misaligned metal baffle ring under the carbureter can cause a similar condition.

Studebaker will make available a supplementary pull back spring that is installed between a tab on one of the exhaust pipe to manifold attaching studs and the carbureter throttle lever. This spring provides more closing force to the throttle.

The heat shield, longer carbureter studs, thicker gaskets, new 75-1444S rod, pull back spring and tab will be distributed through Studebaker dealers under part No. 1549029.

Our stock of 75-1444S has been reworked to include the flat, and a small initial shipment of this part will be made to Carter Centrals.

AS-2876S carbureters incorporating the revised metering rods and additional bowl vents will have a red colored identification tag.

PUMP JET ADJUSTMENT CHANGE

The aiming of the pump jet has been changed to improve acceleration and eliminate stumble complaints encountered on some standard transmission equipped cars. The new aiming procedure aligns the pump jet so that it is parallel to the choke shaft and the stream strikes the venturi about 1/8" down from the top. (See Illustration) This change can be made on the car, using a screw driver blade if reasonable care is used not to damage the jet.

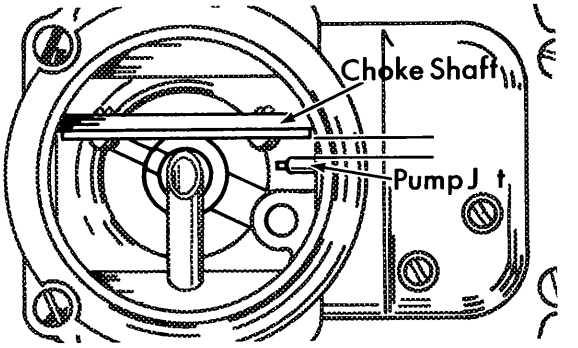

Illustration No. 2

DECELERATION SURGE

A deceleration surge complaint may be encountered with some standard transmission cars. It is not possible to completely remove this surge by any change in carburetion in field service. The following factors should be checked and corrected to minimize the condition:

1. Excessive idle speed.
2. Distributor vacuum or mechanical advance which starts too soon.
3. Intake manifold air leaks.
4. Tight valve or spark plug settings.

R. J. Mullin
Service Supervisor

CARTER MODEL AS CARBURETER FOR STUDEBAKER
SERVICE ADJUSTMENT PROCEDURE

NOTE: The parts and specification pages r f rr d to ar catalog pages. Th s pages can be obtain d from Cart r Carburetor, Catalog Department, St. Louis (7), Missouri. Specify the carbureter number found on the brass identification tag, when requesting speciation pages.

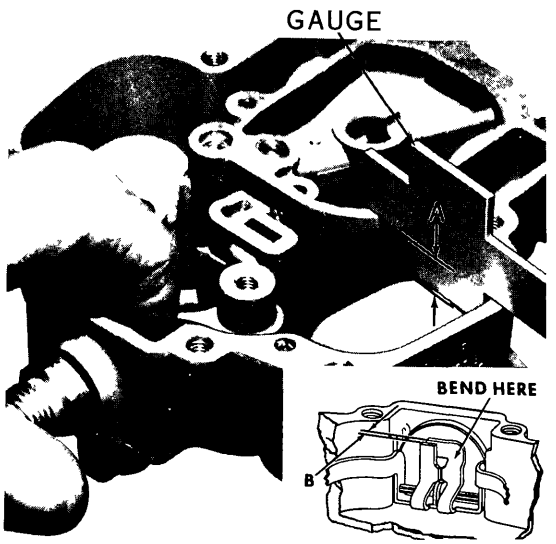

FIGURE No. 1

FLOAT ADJUSTMENT (Fig. 1)

The bowl cover gasket and float pin retainer must be removed. Gauge and adjust each float separately.

1. Hold the lip on float arm against the seated needle making sure the float pin is at the bottom of its guide slots.
2. The distance from the top surface of the body casting to the top of the float (A) should be as listed on carbureter specification page under float adjustment.
3. Adjust by bending lip on float arm. If necessary, bend float arms slightly to provide clearance on all sides of floats.
4. After float adjustment has been made and with both float lips resting against seated needle, there should be the clearance (B) listed on carbureter specification page between overlapping tangs on float levers. This can be checked by installing float pin retainer and turning carbureter upside down allowing floats to drop and make contact against seated needle. Adjust by bending long tang on left hand float.
5. Recheck float level adjustment.

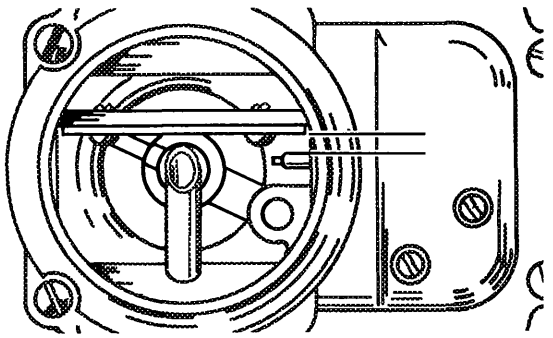

FIGURE No. 2

PUMP JET ADJUSTMENT (Fig. 2)

1. Fill pump cylinder with clean fuel.
2. Operate pump plunger in cylinder while holding finger over discharge passage.
3. With pump jet parallel to choke and throttle shafts the pump stream should hit the side of the small venturi about 1/8" down, as indicated on (Fig. 2).
4. To adjust, bend pump jet tube. Care should be taken to avoid damaging metering end of tube.

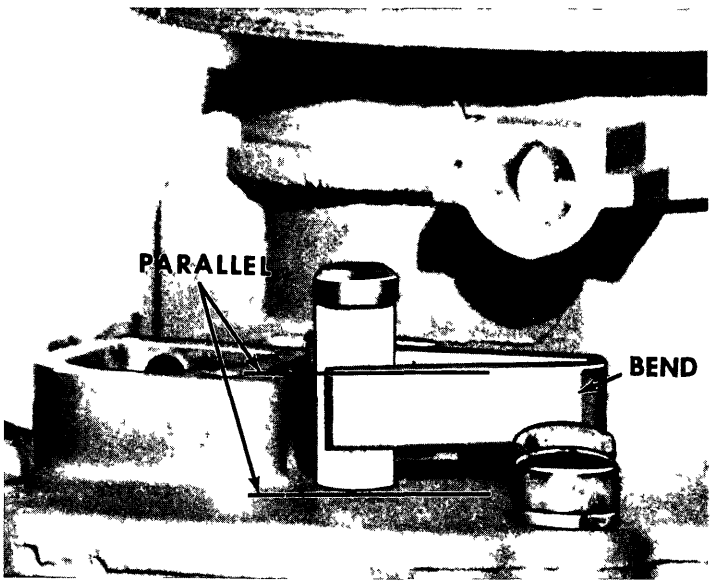

FIGURE No. 3

PUMP ADJUSTMENT (Fig. 3)

1. Open throttle valve to wide open position. Top of pump arm on lifter link should be parallel to top surface of bowl cover.
2. To adjust, bend pump arm.

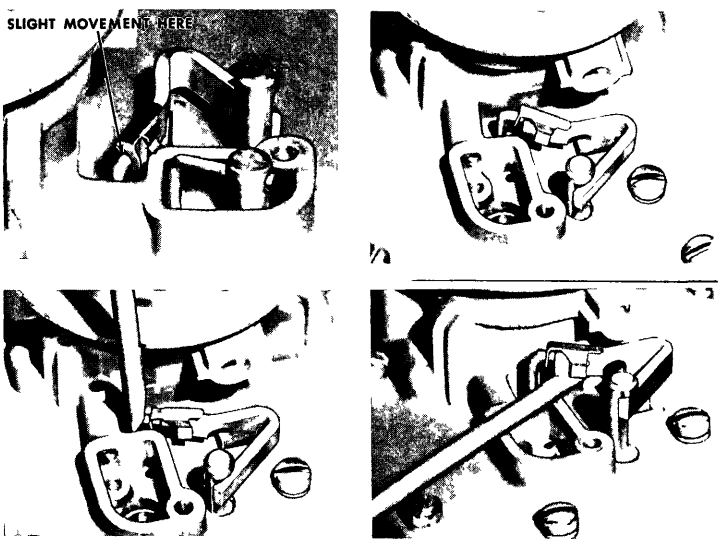

FIGURE No. 4

METERING ROD ADJUSTMENT (Fig. 4)

With throttle valve wide open the metering rod should just bottom in carbureter casting.

1. If the rod is properly adjusted, some movem nt can b noted around rod in the eye of metering rod retain r clip when the throttle is moved slightly from wide open position (Fig. 4A).
2. If the rod is too low it will tend to push the m tering rod r tain r clip up (Fig. 4B).
3. If the rod is too high, it will be possible to push th r d down (Fig. 4C).
4. To adjust bend metering rod arm (Fig. 4D).

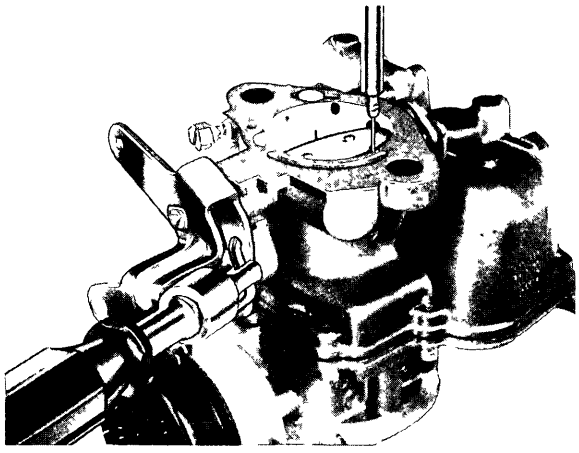
CARBURETER
TRADE MARK REG U S PAT. OFF.
MARCA REGISTRADA



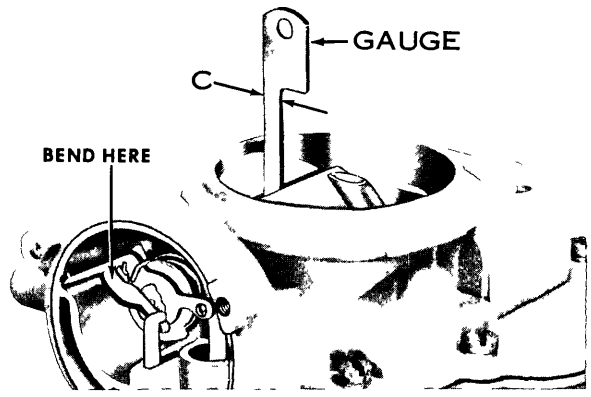


FIGURE No. 5

FAST IDLE ADJUSTMENT (Fig. 5)

1. Remove thermostatic coil housing assembly, gasket and baffle plate.
2. With throttle adjustment screw backed out, crack throttle valve and hold choke valve in fully closed position. Then close throttle. This will allow fast idle cam to revolve to fast idle position.
3. There should now be the clearance listed on carbureter specification page between throttle valve and bore of carbureter (Side opposite idle port).
4. Adjust by bending choke connector rod. (use tool T109-213).

UNLOADER ADJUSTMENT (Fig. 6)

1. Hold throttle valve wide open and close choke valve as far as possible without forcing.
2. There should now be the clearance (C) listed on carbureter specification page between upper edge of choke valve and inner wall of air horn.
3. Adjust by bending arm on choke piston lever. (Use bending tool T109-214).

SERVICE INFORMATION

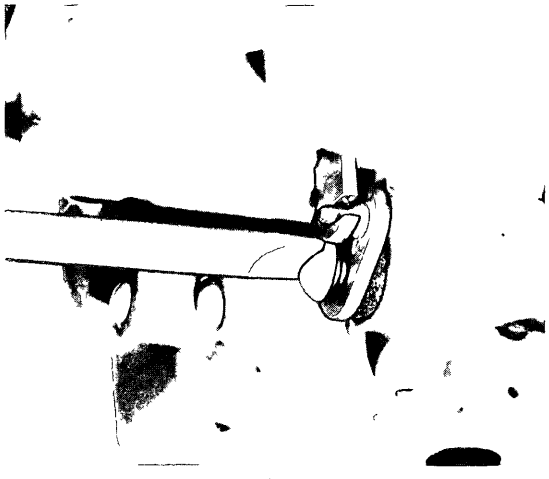

FIGURE No. 1

1. Throttle shaft arm must be removed before carbureter can be disassembled, (Fig. 1).

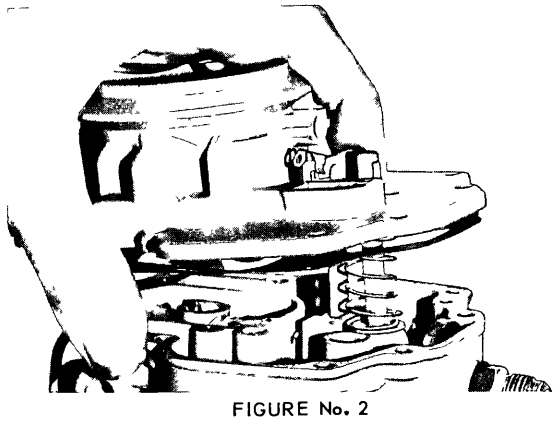

FIGURE No. 2

ASSEMBLING AIR HORN TO BODY(Fig. 2)

1. Place body gasket on air horn.
2. Install metering rod retainer on pump lifter link. (Do not install metering rod at this time.) Insert pump lifter link through operating slot in air horn.
3. Place pump spring over pump plunger and install plunger in air horn.
4. Install fast idle link in choke piston housing.
5. Holding plunger, lifter link and gasket in position, lower bowl cover onto carbureter body (Fig. 2).

INSTALLATION OF METERING ROD (Fig. 3)

1. Place metering rod retainer in position shown in Fig. 3.
2. Lower rod into place until the end of rod enters hole in retainer.
3. Push metering rod and retainer down to operating position. Push retainer toward rod until ears on retainer fit into slot in pump arm on lifter link.

Fill carbureter bowl with clean fuel before installing on manifold. Operation of the float and intake needle and seat may be checked under pressure if the fuel pump is used at the bench to fill the carbureter bowl. Operate the throttle several times and visually check the discharge from the pump jet.

Main Metering Jet: Calibrated to flow 170 cc per minute (Do not gauge for size If in doubt, replace with new part)

Main Vent: Through diffuser (air bleed inside bowl) size 0315 inch diameter

Main Vent Tube: (Side Holes) 7—0197 inch drill—one side spaced 3/16 inch apart First hole 9/16 inch from end 7—0917 inch drill—opposite side spaced 3/16 inch apart First hole 21/32 inch from end Bottom hole, 1—0236 inch drill

Step-Up Jet: Size No 71 (026 inch) drill.

Accelerating Pump: Type, delayed action Inner hole (short stroke) Intermediate setting (center hole) Outer hole (long stroke)

Pump intake passage ball check seat, size 107 to 112 inch diameter

Pump discharge passage, restriction (under ball check) size 062 to 065 inch diameter in body

Pump (discharge) jet size 0236 inch diameter

Pump Adjustment: 14/64 inch plunger travel, with pump link in inner short stroke hole

Choke: Butterfly type with poppet valve

Vacuum Spark Port 052 inch diameter Bottom of port 011 to 021 inch above top edge of valve

Motor Tune-Up—Be Accurate!

CAUTION· **Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.**

Spark Plug Gap .030"	Breaker Point Setting .020"	Ignition Timing Breaker Points to Open: 2° B. T. C. At Vibration Damper	Valve Setting (Cold) Intake .016" Exhaust .016"	Float Setting (Use Gauge) ⅛ Inch ± 1/64 Inch	Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level Wear on lip of float lever will raise float level Before adjusting float, be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 550 r pm Then set idle adjustment screw to specifications If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly Clean tube and passages with compressed air

If acceleration is not satisfactory, remove pump jet and clean with compressed air However, it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a "balance tube" in the air horn The balance tube should be checked each time

CARBURETER
TRADE MARK REG U S PAT. OFF
MARCA REGISTRADA

PRINTED IN U.S.A.

the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of high speed passage beneath float bowl main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly

Pump Adjustment: Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in inner hole (short stroke of throttle shaft arm) Place base of pump travel gauge T109-117S on upper edge of body casting at pump cylinder. With throttle valve seated, turn gauge until projecting finger contacts top of plunger shaft Note number indicated on gauge Repeat with throttle valve wide open and plunger pressed to bottom of the cylinder The difference between the numbers indicated at wide open and closed throttle positions should be "14" (14/64") pump stroke Adjust by bending horizontal portion of pump lifter link

Use 2574S and 202-81U to replace 2575S

WCFB Four-Bore Down-Draft Climatic® Control Carbureters Nos. 2574S-2575S

CARBURETER SPECIFICATIONS

For Studebaker 8 Cylinder 289 Cu. In. Engine: Vacuum at Idle 17.5-19 Inches

Dimensions: Flange size, 1¼ inch Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 1 inch I. D.
Main venturi (secondary) size, 1⅛ inch I. D.

Vents: Inside, 4. Outside, 1 in air horn, 2 in dust cover.

Low Speed Circuit: Primary side only.
Jet, size No. 65 (.035 inch) drill.
By-pass, in body, size No. 52 (.0635 inch) drill.
Economizer, in low speed jet, size (.049 inch) diameter.
Idle bleed, in body, size No. 52 (.0635 inch) drill.
Idle port, slot type, length .174 inch; width .040 inch.

Idle Port Opening: .113 to .119 inch above top edge of valve with valve tightly closed.

Lower Port: (For idle adjustment screw), size No. 53 (.0595 inch) drill.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Idle engine at 550-575 R. P. M. for Std. and O. D. Trans., 575-600 R. P. M. for Automatic Trans. in neutral.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating bleed (to nozzle well), primary side, size No. 67 (.032 inch) drill. Secondary side, size No. 60 (.040 inch) drill.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 74 (.0225 inch) drill. Intake ball check seat, size .115 to .120 inch diameter. Discharge needle seat, size .070 inch diameter. Relief passage (vent) to fuel chamber No. 42 (.0935 inch) drill.

Choke: Carter Climatic® Control, set one point rich. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 43 (.089 inch) drill.

Vacuum Spark Port: Round type, .060 inch diameter. Bottom of port .000 to .010 inch above valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .035"	Breaker Point Setting .013"-.018"	Ignition Timing Breaker Points to Open: 4° B. T. D. C. CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical.

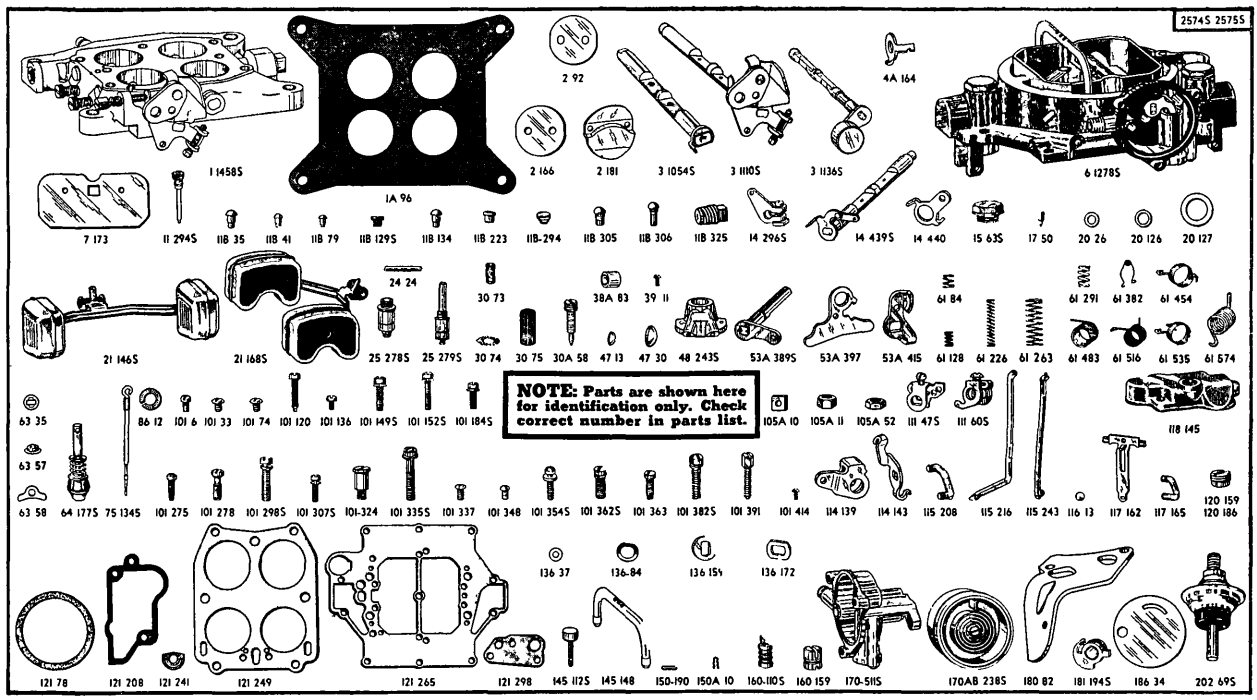
LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge (T109-222) directly under floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats.

VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 3/16 inch for both primary and secondary floats (gauge T109-222). Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 11/16 inch for both primary and secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: (1) Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. (2) With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. (3) Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.



FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .024 inch (gauge T109-189) opening between throttle valve and bore of carbureter, side opposite idle port. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 1/8 inch (gauge T109-36) clearance between lower edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle. (Use bending tool T109-213.) With primary and secondary throttle valves in tightly closed position there should be .010-.030 inch (gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on secondary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

BBR1 DOWNDRAFT **CARBURETER 2724S**

CARBURETER SPECIFICATIONS

For Studebaker Six Cylinder 185 Cu. In. Engine: Vacuum at Idle 17 to 18 Inches

Dimensions Flange size, 1¼ inch S A E
Throttle bore, 1-9/16 inch
Main venturi, 1¼ inch

Float Setting: Top of float 5/64 inch below top surface of carbureter body casting Plus or minus 1/64 inch

Vents Outside, none Inside balance vent Tube in air horn below choke valve

Gasoline Intake Needle: Triangular, horizontal No. 44 (.086 inch) drill in needle seat

Idle Orifice Tube: Jet size .0276 inch diameter Idle passage air bleed (in body) size .067 inch diameter Restriction, in body, size .0545 inch diameter

Idle Ports: Upper port, slot type length, .175 inch width, .040 inch Top of port located .133 to .137 inch above top of valve
Lower port size, .053 to .057 inch diameter (For idle adjustment screw)

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 550-600 r p m

Main Metering Jet: Calibrated to flow 268 to 272 cc per minute (Do not gauge for size If in doubt, replace with new part)

Main Vent Through diffuser (air bleed inside bowl) size .0315 inch diameter

Main Vent Tube· Side Holes 7—.0197 inch drill side holes—one side spaced 3/16 inch apart First hole 5/16 inch from end 7—.0197 inch drill side holes—opposite side spaced 3/16 inch apart First hole 13/32 inch from end Bottom hole 1—.0197 inch drill.

Step-Up Jet: .037 inch drill size

Accelerating Pump: Type delayed action Stroke summer setting (inner hole short stroke) Intermediate setting (center hole) Winter setting (outer hole, long stroke)

Pump intake passage ball check seat size .107 to .112 inch diameter

Pump discharge passage, restriction (under ball check) size .062 to .065 inch diameter in body

Pump (discharge) jet size .0276 inch diameter

Pump Adjustment: 32/64 inch plunger travel, with pump link in medium stroke hole

Choke. Butterfly type with poppet valve

Vacuum Spark Port .110 x .040 inch Top of port .007 to .013 inch below lower edge of valve

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap .030"	Breaker Point Setting .020"	Ignition Timing Breaker Points to Open: 2° B. T. C. At Vibration Damper	Valve Setting (Cold) Intake .016" Exhaust .016"	Float Setting (Use Gauge) 5/64 Inch ± 1/64 Inch	Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level Wear on lip of float lever will raise float level Before adjusting float, be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 550-600 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly Clean tube and passages with compressed air.

If acceleration is not satisfactory, remove pump jet and clean with compressed air However, it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a "balance tube" in the air horn The balance tube should be checked each time

Copyright © 1957

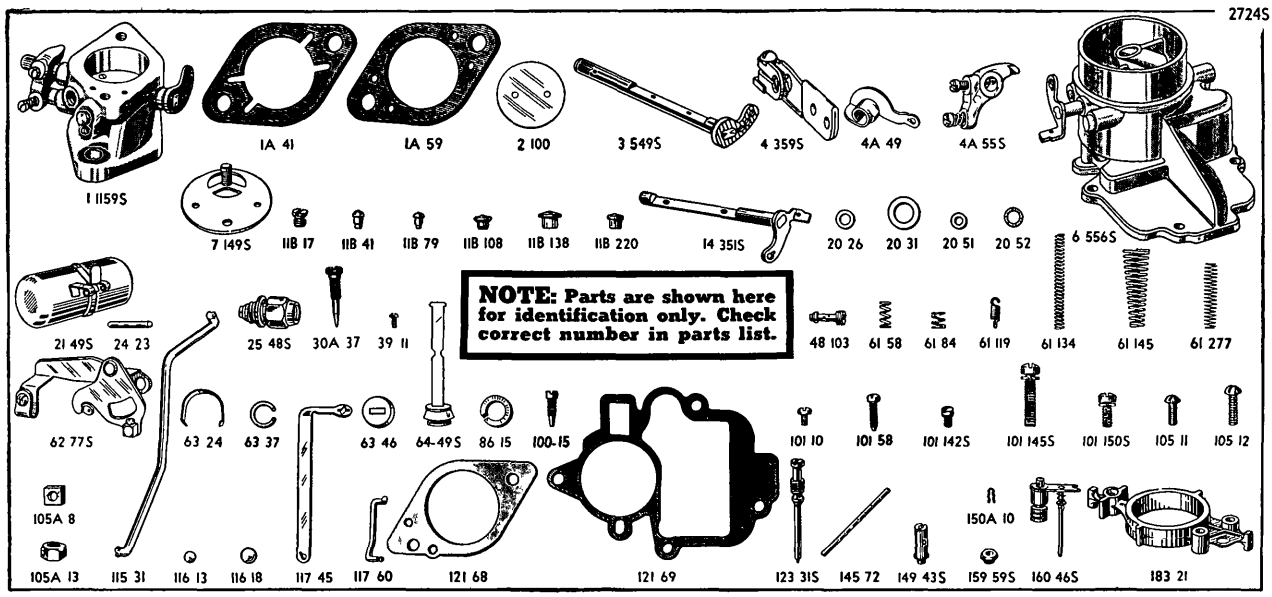
CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA



S S PRINTED IN U S A.

the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43, main vent tube can be removed and a new tube inserted with tool No T109 195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in center hole (medium stroke of throttle shaft arm) Place base of pump travel gauge T109-117S on upper edge of body casting at pump cylinder With throttle valve seated, turn gauge until projecting finger contacts top of plunger shaft Note number indicated on gauge Repeat with throttle valve wide open and plunger pressed to bottom of the cylinder The difference between the numbers indicated at wide open and closed throttle positions should be '32' (32/64") pump stroke Adjust by bending horizontal portion of pump lifter link

Pump stroke is adjustable for high or low temperature Set to longest stroke (outer hole) for cold weather, shorter stroke (inner hole) for hot weather driving

WE Down-Draft Climatic® Control—**Carbs. Nos. 989S-989SA-2108S-2190S-2417S**

CARBURETER SPECIFICATIONS

For Studebaker Six Cylinder Engine: 3 Inch Bore, 4 Inch Stroke (14G-15G)

For Studebaker Six Cylinder Engine: 3 Inch Bore, 4⅜ Inch Stroke (16G-56G-57G-58G)

Dimensions: Flange size, 1¼ inch—special.
Primary venturi size, 11/16 inch I. D.
Main venturi size, 1-5/16 inch I. D.

Vent: Inside, none. Outside, size No. 10 (.1935 inch) drill.

Gasoline Intake: Size No. 46 (.081 inch) drill hole in needle seat.

Low Speed Circuit: (989S-SA) Jet, No. 68 (.031 inch); by-pass, No. 54 (.055 inch); economizer, No. 52 (.0635 inch); bleed, No. 54 (.055 inch). (2108S-2190S) Jet, No. 65 (.035 inch); by-pass, (.053 inch); economizer, No. 55 (.052 inch); bleed, (.047 inch). (2417S) Jet, No. 68 (.031 inch); by-pass, No. 54 (.055 inch); economizer, No. 53 (.0595 inch); bleed, No. 55 (.052 inch).

Idle Port: Upper, (989S-SA) slot type; (2108S-2190S-2417S) key hole type, length .165 inch, width .030 inch. (2108S-2190S-2417S) .042 inch diameter hole at top.

Idle Port Opening: Top of port to be .112 to .116 inch above top edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size (989S-SA) No. 46 (.081 inch) drill; (2108S-2190S-2417S) No. 54 (.055 inch) drill.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Idle engine 525-550 r.p.m. (Syncro-mesh trans.); 575-600 (Overdrive and Hydra-matic trans.).

Main Nozzle: Inside diameter No. 30 (.1285 inch) drill.
Upper hole, .035 inch diameter.
Lower hole, .089 inch diameter.

Metering Rod (Vacumeter Type): (989S-SA-2108S-2417S) .073 x .064 x .050 inch; (2190S) .074 x .065 x .0545 inch diameter.

Metering Rod Jet: Size .095 inch diameter.

Accelerating Pump: Discharge jet, size No. 74 (.0225 inch) drill.
Intake ball check seat, size No. 40 (.098 inch) drill.
Discharge ball check seat, size No. 32 (.116 inch) drill.
Relief passage (to outside), size No. 42 (.0935 inch) drill.

Choke: Carter Climatic ® Control, set one point lean. Butterfly type, offset valve. Choke heat suction hole in body, size No. 41 (.096 inch) drill.

Vacuum Spark Port: (989S-SA) .100 to .102 inch; (2108S-2190S-2417S) .075 to .077 inch diameter. Top of port to be .060 to .070 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Valve Setting Cold	Float Setting	Idle Adjustment Screw Setting
.030"	.020"	2° B. T. D. C. At Vibration Damper	Intake .016" Exhaust .016"	⅜ Inch (Use Gauge T109-80) (Measure from point "A" to top of float seam)	½ to 1½ Syncro-mesh Trans. 525 to 550 R.P.M. O'Dr. & Hydra-matic 575 to 600 R.P.M.

CARBURETER ADJUSTMENTS

Float Adjustment: With bowl cover inverted and float resting on seated needle, the distance from the tip on the edge of the bowl cover to the soldered edge of the seam should be ⅜ inch (gauge T109-80).

Pump Adjustment: With throttle lever set screw backed out and throttle valve seated, place universal pump travel gauge T109-117S on bowl cover with lip of gauge extending over plunger shaft. Hold gauge vertical. The difference between closed and wide open throttle reading at index mark should be 14/64 inch plunger travel.

Adjust by bending throttle connector rod at lower angle. Use tool T109-213.

Metering Rod Adjustment: Metering rod adjustment must be made after pump adjustment or when leaner than standard rods are installed. With throttle lever set screw backed out and throttle valves seated, insert gauge T109-102 in place of metering rod. Press down on metering rod arm until upper lip of arm contacts pin in pump arm. There should now be less than .005 inch between pin and notch in gauge.

Adjust by bending upper lip on metering rod arm.

After adjusting upper lip of metering rod arm, it is necessary to adjust the lower lip. Procedure is as follows: Press down on metering rod arm until upper lip contacts pin in pump arm. Adjust lower lip for 3/16 inch clearance between pin in pump arm and upper surface of lower lip.

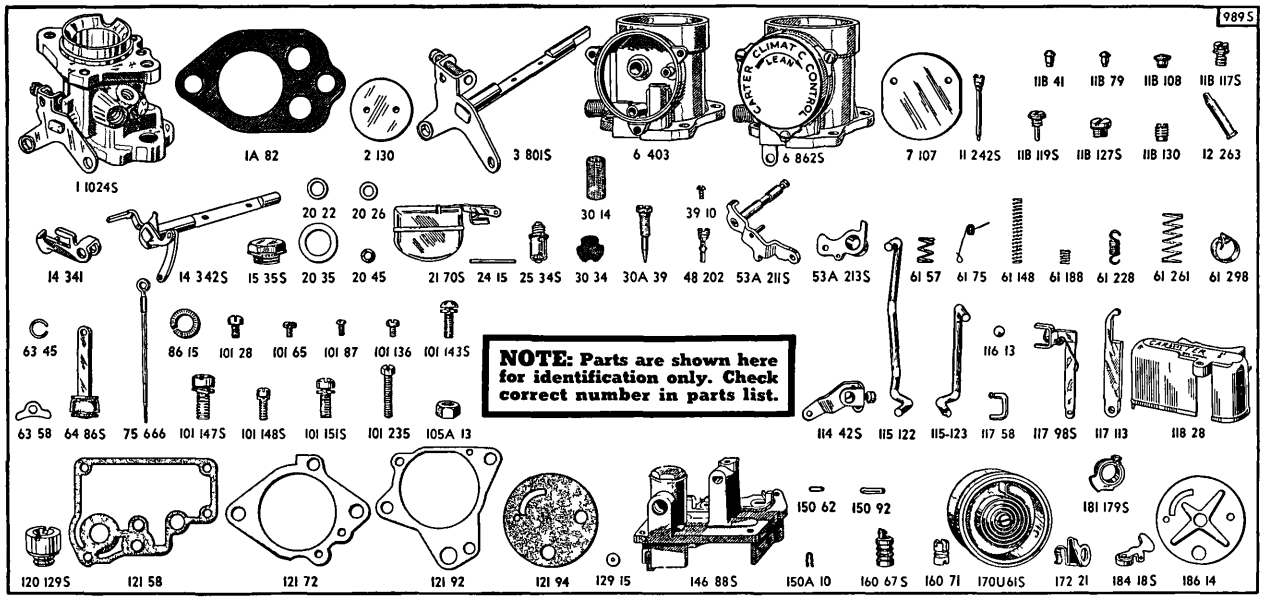
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

Anti-Percolator Adjustment Crack throttle valve 030 inch by placing gauge T109-29 between throttle valve and bore of carbureter side opposite idle port There should now be 025 inch (T109-189 may be used) clearance between rocker arm lip and pump arm



Adjust by bending rocker arm use T109-105

Fast Idle Adjustment With thermostatic coil housing gasket and baffle plate removed, crack throttle valve and hold choke valve closed Then close throttle There should now be 046 inch (T109 158 may be used) between thottle valve and bore of carbureter

Adjust by bending choke connector rod at lower angle use T109-213

Unloader Adjustment Must be made after fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing There should now be 3/16 inch (gauge T109 28) between lower edge of choke valve and inner wall of air horn

Adjust by bending arm on choke trip lever (use tool T109 214)

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2576S**

CARBURETER SPECIFICATIONS

For Studebaker 8 Cylinder Engine 3-9/16 Inch Bore, 3¼ Inch Stroke (3E7, 3E12, 3E13, 3E28, 3E28B, 3E38, 3E38B)

For Studebaker 8 Cylinder Engine 3-9/16 Inch Bore, 3-5/8 Inch Stroke (3E40, 3E40B).

Dimensions. Flange size 1⅛ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi (primary) size 1 inch I D
Main venturi (secondary) size 1⅛ inch I D

Vents Inside 4 Outside 1 in air horn 2 in dust cover

Gasoline Intake Size No 42 (0935 inch) drill hole in needle seat

Low Speed Jet Tube (Primary side only) Jet size No 65 (035 inch) drill By pass in body size No 52 (0635 inch) drill Economizer in low speed jet size 049 inch diameter Idle bleed in body size No 52 (0635 inch) drill

Idle Port. (Upper) slot type Primary length 174 inch width 040 inch Secondary none

Idle Port Opening: Primary 113 to 119 inch above top edge of valve with valve tightly closed Secondary none

Lower Port. Primary (for idle adjustment screw) size No 53 (0595 inch) drill Secondary none

Set Idle Adjustment Screw: ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 550 r p m

Main Nozzle: Installed permanently DO NOT REMOVE Anti percolating bleed (to nozzle well) primary side size No 67 (032 inch) drill Secondary side size No 60 (040 inch) drill

Metering Rod (Vacumeter type) see parts list for size

Metering Rod Jet Primary, size 089 inch diameter (for metering rod) Secondary size (061 inch) diameter (no metering rod)

Accelerating Pump. Discharge jet (twin) primary side only size No 74 (0225 inch) drill Intake ball check seat size 115 to 120 inch diameter Discharge needle seat size 070 inch diameter Relief passage (vent) to fuel chamber No 42 (0935 inch) drill

Choke Carter Climatic® Control set one point rich Butterfly type—offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 43 (089 inch) drill

Vacuum Spark Port. Round type 060 inch diameter Bottom of port 000 to 010 inch above valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical.

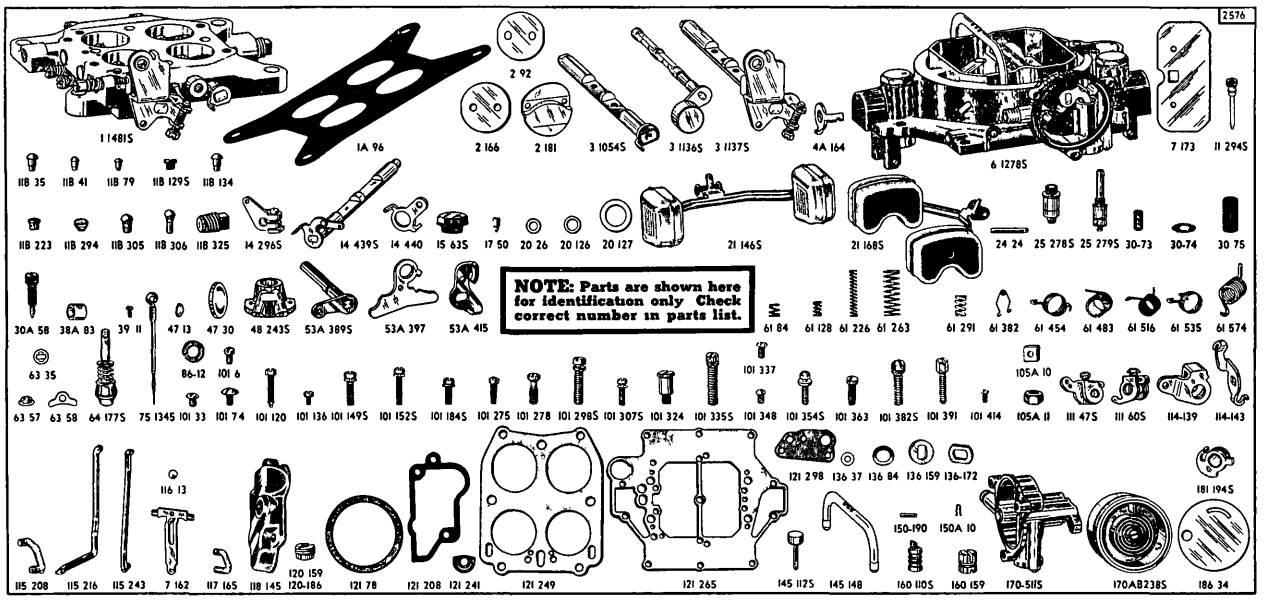
LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge (T109-222) directly under floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats.

VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 3/16 inch for both primary and secondary floats (gauge T109-222). Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 11/16 inch for both primary and secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: (1) Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. (2) With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. (3) Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.



FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .024 inch (gauge T109-189) opening between throttle valve and bore of carbureter, side opposite idle port. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 1/8 inch (gauge T109-36) clearance between lower edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle. (Use bending tool T109-213.) With primary and secondary throttle valves in tightly closed position there should be .017-.022 inch (gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

CARBURETER SPECIFICATIONS

For Studebaker Six Cylinder Engine 3 Inch Bore, 4 3/8 Inch Stroke

Dimensions Flange size 1 1/4 inch S A E
Throttle bore 1 9/16 inch
Main venturi 1 1/4 inch

Float Setting Top of float 5/64 inch below top surface of carbureter body casting Plus or minus 1/64 inch

Vents Outside none Inside balance vent Tube in air horn below choke valve

Gasoline Intake Needle Triangular horizontal No 44 (.086 inch) drill in needle seat

Idle Orifice Tube Jet size .0276 inch diameter Idle passage air bleed (in body) size .067 inch diameter Restriction in body size .0545 inch diameter

Idle Ports Upper port slot type length .175 inch width .040 inch Top of port located .133 to .137 inch above top of valve
Lower port size .053 to .057 inch diameter (For idle adjustment screw)

Set Idle Adjustment Screw 1/2 to 1 1/2 turns open For richer mixture turn screw out Do not idle engine below 550 600 r p m

Main Metering Jet Calibrated to flow 268 to 272 cc per minute (Do not gauge for size If in doubt replace with new part)

Main Vent Through diffuser (air bleed inside bowl) size .0315 inch diameter

Main Vent Tube Side Holes 7—.0197 inch drill side holes—one side spaced 3/16 inch apart First hole 5/16 inch from end 7—.0197 inch drill side holes—opposite side spaced 3/16 inch apart First hole 13/32 inch from end Bottom hole 1—.0197 inch drill

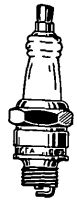
Step-Up Jet .037 inch drill size.

Accelerating Pump Type delayed action Stroke summer setting (inner hole short stroke) Intermediate setting (center hole) Winter setting (outer hole long stroke)

Pump intake passage ball check seat size .107 to .112 inch diameter

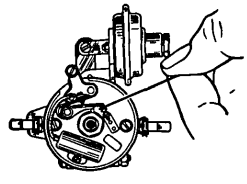
Pump discharge passage restriction (under ball check) size .062 to .065 inch diameter in body

Pump (discharge) jet size .0276 inch diameter



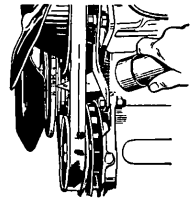
Pump Adjustment 32/64 inch plunger travel with pump link in medium stroke hole

Choke Butterfly type with poppet valve

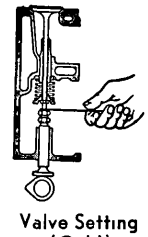


Vacuum Spark Port .110 x .040 inch Top of port .007 to .013 inch below lower edge of valve

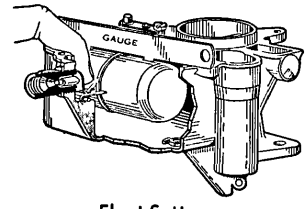
Motor Tune-Up—Be Accurate!



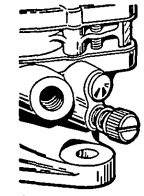
CAUTION **Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter**



Spark Plug Gap .030"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open. 2° B. T. C.

Valve Setting (Cold) Intake .016"-.018" Exhaust .016"-.018"

Float Setting (Use Gauge) 5/64 Inch ± 1/64 Inch

Idle Adjustment Screw Setting 1/2 to 1 1/2 Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level Wear on lip of float lever will raise float level Before adjusting float, be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 550-600 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble remove idle orifice tube and plug assembly Clean tube and passages with compressed air

If acceleration is not satisfactory, remove pump jet and clean with compressed air However, it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to

damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

Correct air fuel ratio is provided by a "balance tube" in the air horn. The balance tube should be checked each time the carbureter is serviced to see that the passage is open. The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner. Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed.

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube. After removal of rivet plug beneath float bowl with tool No. T109-43, main vent tube can be removed and a new tube inserted with tool No. T109-195. Care must be exercised in inserting new tube which must seat tightly. Use new rivet to complete the installation.

Pump Adjustment: Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in center hole (medium stroke of throttle shaft arm). Place base of pump travel gauge T109-117S on upper edge of body casting at pump cylinder. With throttle valve seated, turn gauge until projecting finger contacts top of plunger shaft. Note number indicated on gauge. Repeat with throttle valve wide open and plunger pressed to bottom of the cylinder. The difference between the numbers indicated at wide open and closed throttle positions should be "32" (32/64") pump stroke. Adjust by bending horizontal portion of pump lifter link.

Pump stroke is adjustable for high or low temperature. Set to longest stroke (outer hole) for cold weather, shorter stroke (inner hole) for hot weather driving.

Studebaker Truck — 1955-58 — Carbureter No. 2125S

WHEN SERVICING, USE GASKET ASSORTMENT No. 192, REPAIR PACKAGE No. 1798

Nos. 2214S-2214SA-2214SB-2219S-2219SA-2219SB

NOTE: *When replacing a 2214S or 2219S, use throttle pull back spring, Studebaker No. 537355, and accel. cr ss shaft t carb. actuating spring Studebaker No. 537356 or, remove the throttle lever extension plate by grinding ff attaching rivet and connect existing springs directly to throttle lever.*

CARBURETER SPECIFICATIONS

For Studebaker 8 Cylinder Engine: 3-9/16 Inch Bore, 3-1/4 Inch Stroke (6H, 16G8, 56B)
For Studebaker 8 Cylinder Engine: 3-9/16 Inch Stroke, 3-5/8 Inch Bore (56B, 56H, 57B, 57H, K7)

Dimensions: Flange size, 1⅛ inch Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 15/16 inch.
Main venturi (secondary) size, 15/16 inch I. D.

Float Level: See adjustments.

Vents: Inside, 4. Outside, 3 in air horn, 1 in dust cover. (2214S-SA-2219S-SA — late production), (2214SB-2219SB) cavity fuel drain holes 4—size No. 53 (.0595 inch) drill.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only).
Jet, pressed in place (DO NOT REMOVE) size No. 68 (.031 inch drill.
By Pass, in body, size No. 52 (.0635 inch) drill.
Economizer, in screw plug, size .047 inch diameter.
Idle bleed, in body, size No. 52 (.0635 inch) drill.

Idle Port: (Upper) slot type. Primary, length .174 inch; width .040 inch. Secondary, none.

Idle Port Opening: Primary, .113 to .119 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary, none.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Do not idle engine below 550 r.p.m.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet (to nozzle well), primary side, size No. 67 (.032 inch) drill. Secondary side, size No. 60 (.040 inch) drill.

Metering Rod: Primary, economy step .072 inch diameter. Middle step tapers to .062 inch diameter. Power step, .060 inch diameter. Secondary, none.

Metering Rod Jet: Primary, size .089 inch diameter (for metering rod). Secondary, size No. 53 (.0595 inch) drill (no metering rod).

Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 73 (.024 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.
Relief passage (vent) to fuel chamber No. 42 (.0935 inch) drill.

Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set one point rich. Butt r-fly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 44 (.086 inch) drill.

Vacuum Spark Port: Round type, .060 inch diameter. Bottom of port 000 to .010 inch above valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing	Valve Setting (Cold)	Float Setting	Idle Adjustment Screw Setting

MARCA REGISTRADA

S. S. PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

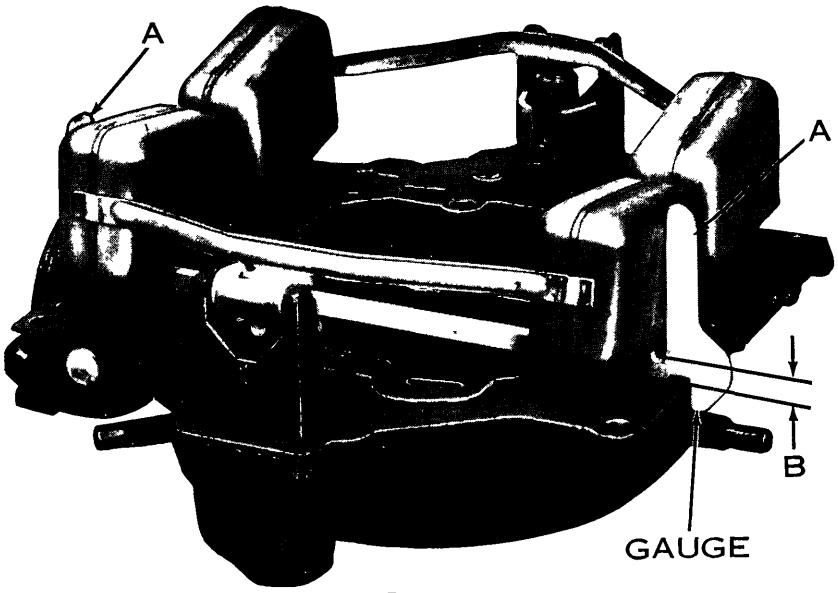

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):
Two separate float adjustments must be made — lateral and vertical. LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge (T109-222) directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge (A). Adjustment should be made by bending arms of floats. VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance (B) between top of float and machined surface of casting must be 3/16 inch for both primary and secondary floats (gauge T109-222). Adjust by bending float arms.

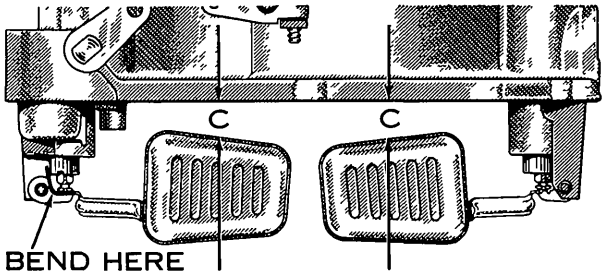

Figure 2
Float Drop Adjustment

FLOAT DROP ADJUSTMENT (Fig. 2):
With bowl cover held in upright position and measuring from center of float, the distance between top of floats (C) and bowl cover should be 11/16 inch for both primary and secondary floats. Adjust by bending stop tabs on float brackets

PUMP ADJUSTMENT (Fig. 3):
Install pump connector link in outer hole (long stroke) of pump arm, with ends extending outward toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.) CAUTION: On 2214S-2214SA carbureter, after completing pump adjustment, there should be a minimum of .015 clearance between the lower edge of the countershaft arm (D) and the dash pot bracket. If necessary, correct by bending pump connector rod slightly.

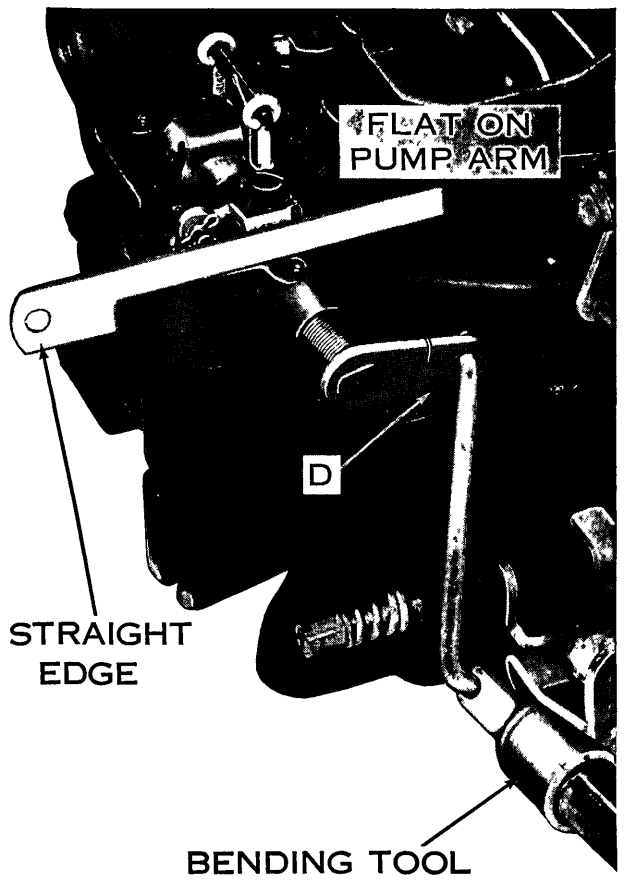

Figure 3
Pump Adjustm nt

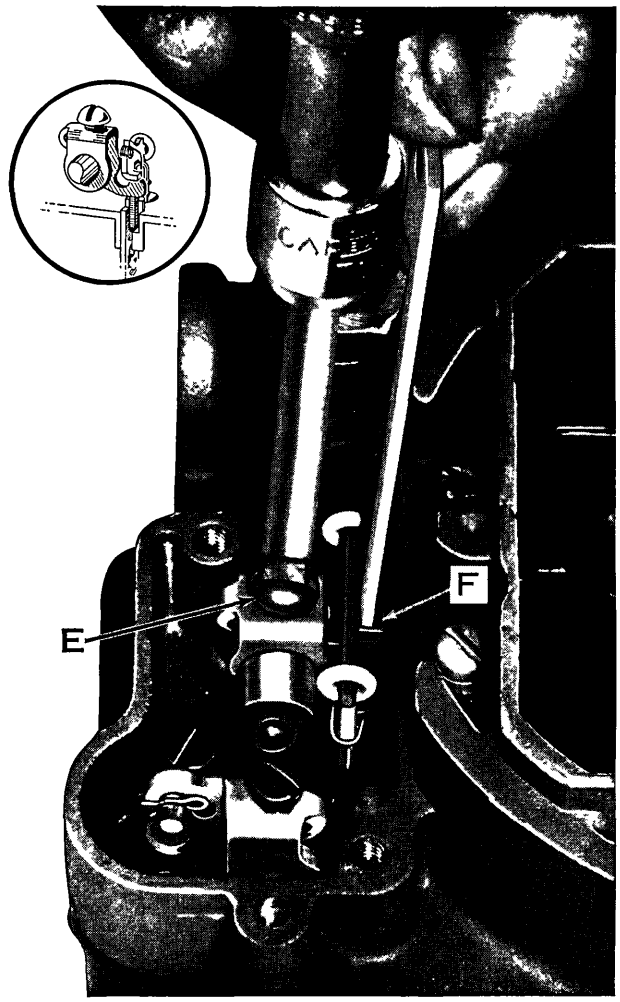

Figure 4
Metering Rod Adjustment

METERING ROD ADJUSTMENT (Fig. 4):

Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: 1. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (E). 2. With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. 3. Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link (F). Hold in place and carefully tighten clamp screw.

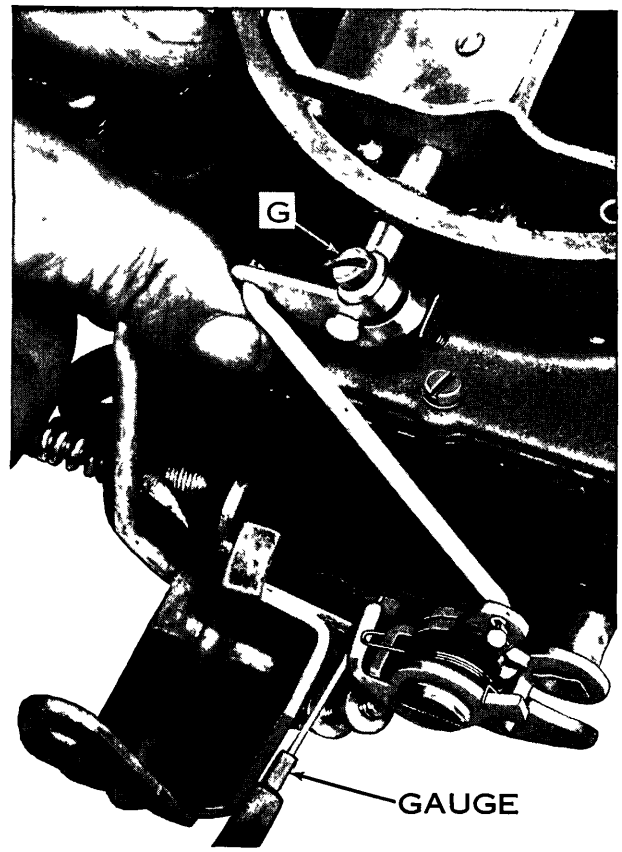

Figure 5A
Fast Idle Adjustment

FAST IDLE ADJUSTMENT (Fig. 5A and 5B):
(Fig. 5A): Loosen choke lever clamp screw (G) on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw.
(Fig. 5B): With choke valve tightly closed, tighten fast idle adjusting screw (H) until there is .024 inch (gauge T109-189 may be used) opening between throttle valve and bore of carbureter, side opposite idle port. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

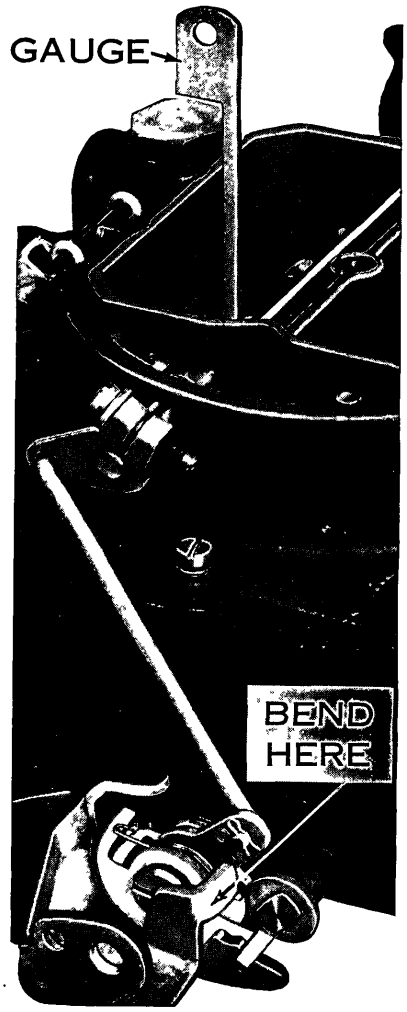

Figure 6
Unloader Adjustment

UNLOADER ADJUSTMENT (Fig. 6):

With throttle wide open there should be 1/8 inch (gauge T109-36) clearance between lower edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (Use bending tool T109-41).

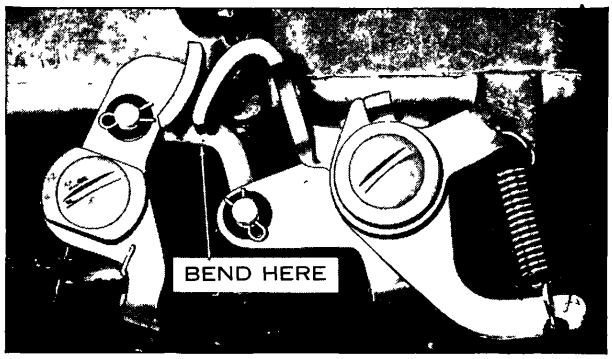

Figure 7
Secondary Throttle Lever Adjustment

SECONDARY THROTTLE LEVER ADJUSTMENT (Fig. 7):

Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle. (Use bending tool T109-213.)

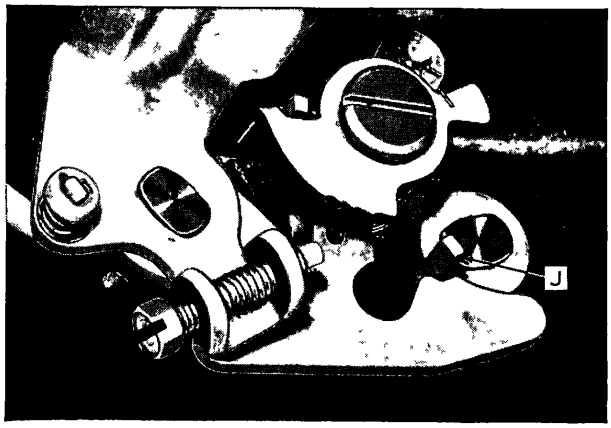

Figure 8
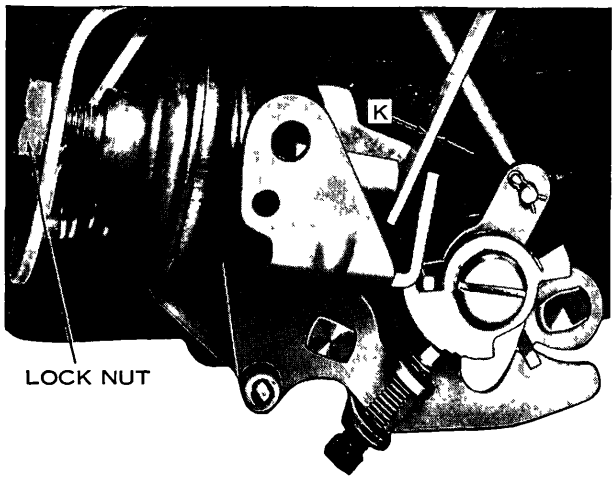
Secondary Throttle Lock-Out Adjustment

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT (Fig. 8):

This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever (J) should freely engage in notch of lock-out dog. If necessary to adjust, bend tang (J) on secondary throttle lever.



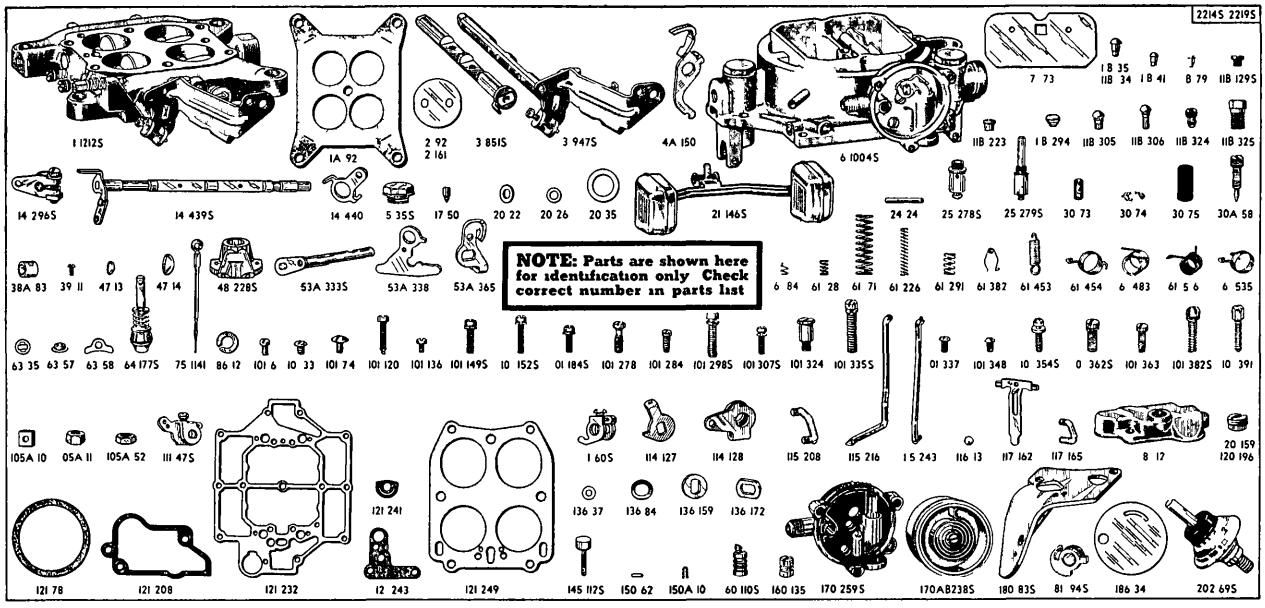


Figure 9
Dash Pot (Slow Closing Throttle) Adjustment

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT (Fig. 9):

The purpose of this unit is to prevent the car from stalling when the throttle is released rapidly. To get proper dash pot action this adjustment must be made after the Fast Idle Adjustment. With the choke valve tightly closed and fast idle adjustment screw on the high step of the cam loosen lock-nut and adjust dash pot unit to give 1/16 inch clearance (K) between throttle lever and lower tip of plunger shaft. Then tighten lock-nut.

BBR1 DOWN-DRAFT **CARBURETERS Nos. 777S-777SA**

CARBURETER SPECIFICATIONS

For Studebaker 6 Cylinder Engine: 3-5/16 Inch Bore, 4¾ Inch Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Throttle bore, 1-9/16 inch.
Main venturi, 1-5/16 inch.

Float Setting: Top of float 7/64 inch below top surface of carbureter body casting. Plus or minus 1/64 inch.

Vents: Outside, none. Inside balance vent tube, to air horn above choke valve.

Gasoline Intake Needle: Triangular, horizontal No. 44 (.086) inch drill in needle seat.

Idle Orifice Tube: Jet size, .031 inch. Idle passage air bleed (in body) size, .067 inch diameter. Restriction, in body, size .059 to .060 inch diameter.

Idle Ports: Upper port, slot type, length, .175 inch; width .030 inch. Top of port located .141 to .145 inch above top of valve. Lower port size, .053 to .057 inch diameter. (For idle adjustment screw.)

Set Idle Adjustment Screw: ¾ to 1¼ turns open. For richer mixture, turn screw out. Do not idle engine below 550-600 r.p.m.

Main Metering Jet: Calibrated to flow 328 to 332 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl) size, .038 inch drill.

Main Vent Tube: Side holes: 1—No. 68 (.031) inch diameter, ⅜ inch from end.

1—No. 68 (.031) inch diameter, 29/64 inch from end.
1—No. 70 (.028) inch diameter, 9/16 inch from end.
1—No. 70 (.028) inch diameter, 41/64 inch from end.
1—No. 70 (.028) inch diameter, ¾ inch from end.
1—No. 73 (.024) inch diameter, ⅞ inch from end.
1—No. 76 (.020) inch diameter, 1⅜ inch from end.

Step-Up Jet: (777S) No. 63 (.037 inch) drill.
(777SA) No. 65 (.035 inch) drill.

Accelerating Pump: Type, delayed action. Stroke, summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke).

Pump intake passage, ball check seat, size .107 to .112 inch diameter.

Pump discharge passage; restriction (under ball check) size .062 to .065 inch diameter in body.

Pump (discharge) jet size .0315 inch.

Pump Adjustment: 35/64 inch plunger travel, with pump link in medium stroke hole.

Choke: Butterfly type, with poppet valve.

Vacuum Spark Port: Horizontal slot type; size, .040 by .110 inch. Bottom of port: .007 to .013 inch above top edge of valve.

MOTOR TUNE-UP

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open:	Set Valves (Cold)	Float Setting (Use Gauge)	Idle Adjustment Screw Setting
.030"	.020"	2° B. T. D. C.	Intake .016" Exhaust .016"	7/64 Inch ± 1/64 Inch	¾ to 1¼ Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 550 r.p.m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly. Clean tube and passages with compressed air.

If acceleration is not satisfactory, remove pump jet and clean with compressed air. However, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

Correct air fuel ratio is provided by a "balance tube" in the air horn. The balance tube should be checked each time the carbureter is serviced to see that the passage is open. The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner. Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed.

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube. After removal of rivet plug beneath float bowl with tool No. T109-43, main vent tube can be removed and a new tube inserted with tool No. T109-195. Care must be exercised in inserting new tube which must seat tightly. Use new rivet to complete the installation.

Pump Adjustment: Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in center hole (medium stroke of throttle shaft arm). Place base of pump travel gauge T109-117S on upper edge of body casting at pump cylinder. With throttle valve seated, turn gauge until projecting finger contacts top of plunger shaft. Note number indicated on gauge. Repeat with throttle valve wide open and plunger pressed to bottom of the cylinder. The difference between the numbers indicated at wide open and closed throttle positions should be "35" (35/64") pump stroke. Adjust by bending horizontal portion of pump lifter link.

Pump stroke is adjustable for high or low temperature. Set to longest stroke (outer hole) for cold weather, shorter stroke (inner hole) for hot weather driving.

BBR1 DOWN-DRAFT **CARBURETERS 606S-606SA-606SB**

CARBURETER SPECIFICATIONS

For Studebaker Six Cylinder Engine (2R16-2R17): 3-5/16 Inch Bore, 4⅜ Inch Stroke

For Studebaker Six Cylinder Engine (2R16A-2R17A-3R16-3R17-E16-E17-3E16-3E17): 3-5/16 Inch Bore, 4¾ Inch Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Throttle bore 1-9/16 inch.
Main venturi, 1-5/16 inch.

Float Setting: Top of float 7/64 inch below top surface of carbureter body casting. Plus or minus 1/64 inch. Float setting for spring loaded needle and seat assembly: See footnote (†) on page two.

Vents: Outside, none. Inside balance vent: .218 inch diameter.

Gasoline Intake Needle: Triangular, horizontal No. 44 (.086) inch drill in needle seat.

Idle Orifice Tube: Jet size, .0276 inch.
Idle passage air bleed (in body) size, .067 inch diameter.
Restriction, in body, size .054 to .055 inch diameter.

Idle Ports: Upper port, slot type, length, .160 inch; width, .030 inch. Top of port located .123 to .127 inch above top of valve.

Lower port size, .053 to .057 inch diameter. (For idle adjustment screw.)

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture, turn screw out. Do not idle engine below 550-600 r.p.m.

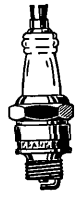
Main Metering Jet: Calibrated to flow 328 to 332 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl) size, .038 inch drill.

Main Vent Tube: Side holes: 1—No. 68 (.031) inch diameter, ⅜ inch from end.
1—No. 68 (.031 inch) diameter 29/64 inch from end.
1—No. 70 (.028 inch) diameter 9/16 inch from end.
1—No. 70 (.028 inch) diameter 41/64 inch from end.
1—No. 70 (.028 inch) diameter ¾ inch from end.
1—No. 73 (.024 inch) diameter ⅞ inch from end.
1—No. 76 (.020 inch) diameter 1⅜ inch from end.

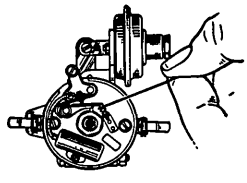
Step-Up Jet: 1.05 mm (.0413") drill (std.), No. 56 (.0465") drill (1 size rich).

Accelerating Pump: Type, delayed action. Stroke, summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke). Pump intake passage, ball check seat, size .115 to .120 inch diameter. Pump discharge passage; restriction (under ball check) size .062 to 065 inch diameter in body.
Pump (discharge) jet size, .0315 inch.



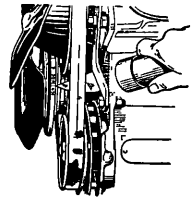
Pump Adjustment: 37/64 inch plunger travel, with pump link in medium stroke hole.

Choke: Butterfly type, with poppet valve.



Vacuum Spark Port: Horizontal slot type; size, .040 by .110 inch. Bottom of port: .007 to 013 inch above top edge of valve.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

WCFB Four-Bore Down-Draft Climatic® Control **Carbureter No. 2394S**

CARBURETER SPECIFICATIONS

For Studebaker 8 Cylinder Engine: 4 Inch Bore, 3½ Inch Stroke

Dimensions: Flange size, 1¼ inch Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 1-1/16 inch I. D.
Main venturi (secondary) size, 1¼ inch I. D.

Vents: Outside, 4. Inside, 5.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only). Jet, size No. 65 (.035 inch) drill.
By-Pass, in body, size No. 54 (.055 inch) drill.
Economizer, in screw plug, size .0492 inch diameter.
Idle Bleed, in body, size .063 inch diameter.

Idle Port: (Upper) slot type. Primary, length .185 inch; width .030 inch. Secondary, none.

Idle Port Opening: Primary, .130 to 136 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill. Secondary, none.

Set Idle Adjustment Screw: ¾ to 1¾ turns open. For richer mixture turn screw out Do not idle engine below 550 r.p.m. Automatic Trans.—in neutral.

Main Nozzle: Installed permanently. DO NOT REMOVE. Anti-percolating jet, primary and secondary, size No. 70 (.028 inch) drill.

Metering Rod: Primary, economy step .072 inch diameter. Middle step tapers to .055 inch diameter. Power step, .040 inch diameter. Secondary, none.

Metering Rod Jet: Primary size .0935 inch; secondary size .0785 inch diameter.

Accelerating Pump: Discharge jet (Twin) primary side only, size No. 72 (.025 inch) drill. Intake ball check seat, size .115 to .120 diameter. Discharge needle seat, size .070 inch diameter. Pump passage disk check, size No. 55 (.052 inch) drill.

Choke: Carter Climatic® Control, set on index. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 43 (.089 inch) drill.

Vacuum Spark Port: Horizontal, slot, round end type—.130 x .040 inch. Bottom of port to be .000 to .006 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!

CAUTION: *Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.*

S S PRINTED IN U.S.A.

CARBURETER ADJUSTMENTS

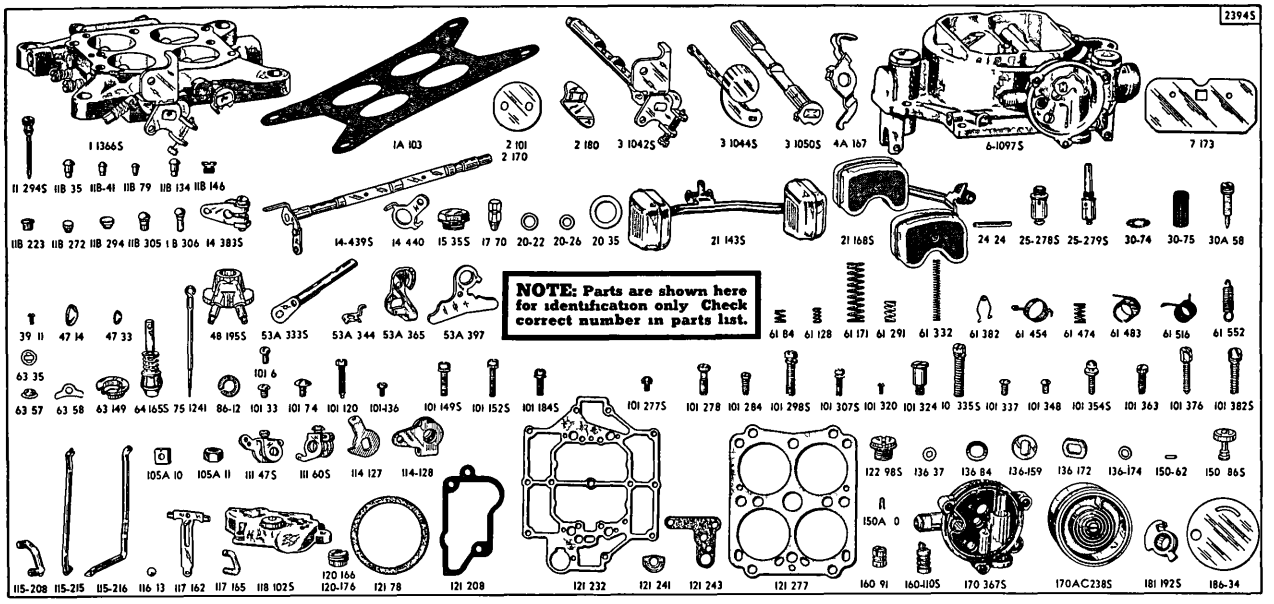
FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical. LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge directly under center of floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats. VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 1/8 inch (gauge T109-232) for primary floats and 3/16 inch (gauge T109-222) for secondary floats. Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 5/8 inch for primary floats and 11/16 inch for secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves s at in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)

METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. Nc metering rod gauges are necessary. Procedure is as follows: (1) Back out throttle lever set screw to allow throttl valves to seat in bores of carbureter and loosen metering rod arm clamp screw. (2) With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. (3) Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

BOWL VAPOR VENT ADJUSTMENT: This adjustment should be made after completing pump and metering rod adjustments. Install dust cover and dust cover gasket. Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter. There should be 1/16 inch (gauge T109-197) between lower edge of bowl vapor vent valve and dust cover. To adjust, remove dust cover and bend vapor vent arm.



FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .025 inch wire gauge (T109-189) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed tighten fast idle adjusting screw until there is .023 inch (gauge T109-189) opening between throttle valve and bore of carbureter side opposite idle port. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 9/32 inch (gauge T109-126) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle. (Use bending tool T109-213.) With primary and secondary throttle valves in tightly closed position there should be .008-.013 inch (gauge T109-200) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and hold choke valve tightly closed. Then close throttle. Tang on secondary throttle lever should freely engage in notch of lockout dog. If necessary to adjust, bend tang on secondary throttle lever.

WCFB Four-Bore Down-Draft Climatic® Control **Carbureters Nos. 2224S-2224SB**

CARBURETER SPECIFICATIONS

For Studebaker 8 Cylinder Engine: 3-9/16 Inch Bore, 3¼ Inch Stroke (E38, 2E38, 2E38B)
For Studebaker 8 Cylinder Engine: 3-9/16 Inch Bore, 2-13/16 Inch Stroke (2E7, 2E12)

Dimensions: Flange size, 1⅛ inch Four Bore—4 bolt type.
Primary venturi size, 11/32 inch I. D.
Main venturi (primary) size, 15/16 inch.
Main venturi (secondary) size, 15/16 inch I. D.

Float Level: See adjustments.

Vents: Inside, 4. Outside, 3 in air horn, 1 in dust cover. (2224SB) Cavity fuel drain holes 4—size No. 53 (.0595 inch) drill.

Gasoline Intake: Size No. 42 (.0935 inch) drill hole in needle seat.

Low Speed Jet Tube: (Primary side only).
Jet, pressed in place (DO NOT REMOVE) size No. 68 (.031 inch) drill.
By-pass, in body, size No. 52 (.0635 inch) drill.
Economizer, in screw plug, size .047 inch diameter.
Idle bleed, in body, size No. 52 (.0635 inch) drill.

Idle Port: (Upper) slot type. Primary, length .174 inch; width .040 inch. Secondary, none.

Idle Port Opening: Primary, .113 to .119 inch above top edge of valve with valve tightly closed. Secondary, none.

Lower Port: Primary (for idle adjustment screw), size No. 53 (.0595 inch) drill.
Secondary, none.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Do not idle engine below 550 r.p.m.

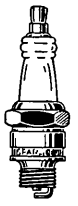
Main Nozzle: Installed permanently. DO NOT REMOVE. Anti percolating jet (to nozzle well), primary side, size No. 67 (.032 inch) drill. Secondary side, size No. 60 (.040 inch) drill.

Metering Rod: Primary, economy step .072 inch diameter. Middle step tapers to .062 inch diameter. Power step, .060 inch diameter. Secondary, none.

Metering Rod Jet: Primary, size .089 inch diameter (for metering rod).
Secondary, size No. 53 (.0595 inch) drill (no metering rod).

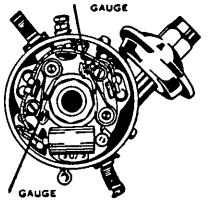
Metering Rod Setting: See adjustments.

Accelerating Pump: Discharge jet (twin) primary side only, size No. 73 (.024 inch) drill.
Intake ball check seat, size .115 to .120 inch diameter.
Discharge needle seat, size .070 inch diameter.
Relief passage (vent) to fuel chamber No. 42 (.0935 inch) drill.



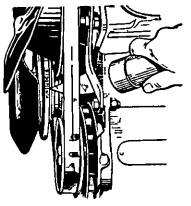
Pump Adjustment: See adjustments.

Choke: Carter Climatic® Control, set one point rich. Butterfly type—offset choke valve, primary side only. Choke heat suction hole, restriction in piston housing, size No. 44 (.086 inch) drill.



Vacuum Spark Port: Round type, .060 inch diameter. Bottom of port .000 to .010 inch above valve with valve tightly closed.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

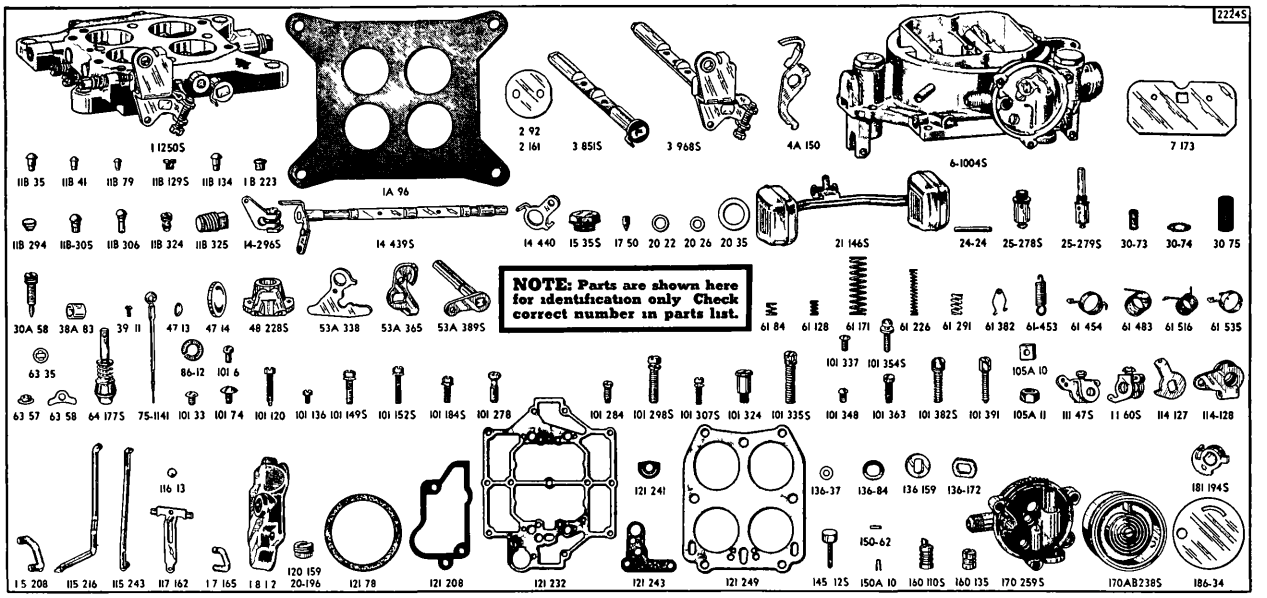
FLOAT ADJUSTMENT: Two separate float adjustments must be made—lateral and vertical.

LATERAL ADJUSTMENT: With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge (T109-222) directly under floats with notched portion of gauge fitted over edge of casting. Side of floats should just clear the vertical uprights of float gauge. Adjustment should be made by bending arms of floats.

VERTICAL ADJUSTMENT: With float gauge in same position, floats should just clear the horizontal portion of gauge. Vertical distance between top of float and machined surface of casting must be 3/16 inch for both primary and secondary floats (gauge T109-222). Adjust by bending float arms.

FLOAT DROP ADJUSTMENT: With bowl cover held in upright position and measuring from center of float, the distance between top of floats and bowl cover should be 11/16 inch for both primary and secondary floats. Adjust by bending stop tabs on float brackets.

PUMP ADJUSTMENT: Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm. Back out throttle lever set screw until throttle valves seat in bores of carbureter. Hold straight edge across top of dust cover boss at pump arm. The flat on top of pump arm should be parallel to straight edge. Adjust by bending throttle connector rod at lower angle. (Use tool T109-213.)



METERING ROD ADJUSTMENT: Metering rod adjustment is important and must be made after completing the pump adjustment. No metering rod gauges are necessary. Procedure is as follows: (1) Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw. (2) With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting. (3) Holding rods in downward position and throttle valves seated, revolve metering rod arm until finger on arm contacts lip of vacumeter link. Hold in place and carefully tighten clamp screw.

FAST IDLE ADJUSTMENT: (a) Loosen choke lever clamp screw on choke shaft. Insert .020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting. Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw. (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is .024 inch (gauge T109-189) opening between throttle valve and bore of carbureter, side opposite idle port. Be sure fast idle adjusting screw is on high step of cam while making this adjustment.

UNLOADER ADJUSTMENT: With throttle wide open there should be 1/8 inch (gauge T109-36) clearance between upper edge of choke valve and inner wall of air horn. Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41).

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time. To adjust, bend throttle operating rod at upper angle. (Use bending tool T109-213.) With primary and secondary throttle valves in tightly closed position there should be .017-.022 inch (gauge T109-29) clearance between positive closing shoes on primary and secondary throttle levers. To adjust, bend shoe on primary lever.

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT: This adjustment should be made after completing fast idle and secondary throttle lever adjustments. Crack throttle valves and manually open and close the choke valve. Tang on secondary throttle lever should freely engage in notch of lock-out dog. If necessary to adjust, bend tang on secondary throttle lever.

WCFB Four-Bore Down-Draft Climatic® Control Carbureters **Nos. 2330S-2330SB**

CARBURETER SPECIFICATIONS

For Studebaker 8 Cylinder Engine 3-9/16 Inch Bore, 3¼ Inch Stroke

Dimensions Flange size 1⅛ inch Four Bore—4 bolt type
Primary venturi size 11/32 inch I D
Main venturi (primary) size 15/16 inch
Main venturi (secondary) size 15/16 inch I D

Float Level See adjustments

Vents Inside 4 Outside 3 in air horn 1 in dust cover (2330SB) Cavity fuel drain holes 4—size No 53 (0595 inch) drill

Gasoline Intake Size No 42 (0935 inch) drill hole in needle seat

Low Speed Jet Tube (Primary side only)
Jet pressed in place (DO NOT REMOVE) size No 68 (031 inch) drill
By pass in body size No 52 (0635 inch) drill
Economizer in screw plug size 047 inch diameter
Idle bleed in body size No 52 (0635 inch) drill

Idle Port (Upper) slot type Primary length 174 inch width 040 inch
Secondary none

Idle Port Opening Primary 113 to 119 inch above top edge of valve with valve tightly closed Secondary none

Lower Port Primary (for idle adjustment screw) size No 53 (0595 inch) drill
Secondary none

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 550 r p m in neutral

Main Nozzle Installed permanently DO NOT REMOVE Anti percolating jet (off nozzle well) primary side size No 67 (032 inch) drill
Secondary side size No 60 (040 inch) drill

Metering Rod Primary economy step 0725 inch diameter
Power step 063 inch diameter
Secondary none

Metering Rod Jet Primary size 089 inch diameter (for metering rod)
Secondary size No 53 (0595 inch) drill (no metering rod)

Metering Rod Setting See adjustments

Accelerating Pump Discharge jet (twin) primary side only size No 73 (024 inch) drill
Intake ball check seat size 115 to 120 inch diameter
Discharge needle seat size 070 inch diameter
Relief passage (vent) to fuel chamber No 42 (0935 inch) drill

Pump Adjustment See adjustments

Choke Carter Climatic® Control set one point rich Butterfly type offset choke valve primary side only Choke heat suction hole restriction in piston housing size No 44 (086 inch) drill

Vacuum Spark Port Round type 060 inch diameter Bottom of port 000 to 010 inch above valve with valve tightly closed

Motor Tune-Up—Be Accurate!

CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

Spark Plug Gap	Breaker Point Setting	Ignition Timing Breaker Points to Open	Valve Setting (Cold)	Float Setting	Idle Adjustment Screw Setting
.035"	.013"-.018"	4° B T. D C. At Vibration Damper	Intake .025"-.027" Exhaust .025"-.027"	(See Adjustments)	½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical

LATERAL ADJUSTMENT With bowl cover assembly inverted, bowl cover gasket removed and float resting on seated needle, place float gauge (T109-222) directly under floats with notched portion of gauge fitted over edge of casting Side of floats should just clear the vertical uprights of float gauge Adjustment should be made by bending arms of floats

VERTICAL ADJUSTMENT With float gauge in same position, floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting must be 3/16 inch for both primary and secondary floats (gauge T109-222) Adjust by bending float arms

FLOAT DROP ADJUSTMENT With bowl cover held in upright position and measuring from center of float the distance between top of floats and bowl cover should be 11/16 inch for both primary and secondary floats Adjust by bending stop tabs on float brackets

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

S S PRINTED IN U.S.A.

PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm, with ends extending toward countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Hold straight edge across top of dust cover boss at pump arm The flat on top of pump arm should be parallel to straight edge Adjust by bending throttle connector rod at lower angle (Use tool T109-213)

METERING ROD ADJUSTMENT. Metering rod adjustment is important and must be made after completing the pump adjustment No metering rod gauges are necessary Procedure is as follows (1) Back out throttle lever set screw to allow throttle valves to seat in bores of carbureter and loosen metering rod arm clamp screw (2) With metering rods in place, press down on vacumeter link until metering rods bottom in carbureter body casting (3) Holding rods in downward position and throttle valves seated revolve metering rod arm until finger on arm contacts lip of vacumeter link Hold in place and carefully tighten clamp screw

FAST IDLE ADJUSTMENT (a) Loosen choke lever clamp screw on choke shaft Insert 020 inch feeler gauge (T109-29) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position—hold in place and tighten clamp screw (b) With choke valve tightly closed, tighten fast idle adjusting screw until there is 024 inch (gauge T109-189) opening between throttle valve and bore of carbureter, side opposite idle port Be sure fast idle adjusting screw is on high step of cam while making this adjustment

UNLOADER ADJUSTMENT: With throttle wide open there should be ⅛ inch (gauge T109-36) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109 41)

SECONDARY THROTTLE LEVER ADJUSTMENT: Primary and secondary throttle valves should reach wide open position at the same time To adjust, bend throttle operating rod at upper angle (Use bending tool T109-213) With primary and secondary throttle valves in tightly closed position there should be 017- 022 inch (gauge T109 29) clearance between positive closing shoes on primary and secondary throttle levers To adjust, bend shoe on primary lever

SECONDARY THROTTLE LOCK-OUT ADJUSTMENT. This adjustment should be made after completing fast idle and secondary throttle lever adjustments Crack throttle valves and manually open and close the choke valve Tang on secondary throttle lever should freely engage in notch of lock-out dog If necessary to adjust, bend tang on secondary throttle lever

DASH POT (SLOW CLOSING THROTTLE) ADJUSTMENT The purpose of this unit is to prevent the car from stalling when the throttle is released rapidly To get proper dash pot action this adjustment must be made after the Fast Idle Adjustment With the choke valve tightly closed and fast idle adjustment screw on the high step of the cam loosen lock-nut and adjust dash pot unit to give 1/16 inch clearance between throttle lever and lower tip of plunger shaft Then tighten lock-nut

CARBURETER SPECIFICATIONS

For Studebaker Six Cylinder Engine 3 Inch Bore 4 Inch Stroke

Dimensions Flange size 1¼ inch S A E
Throttle bore 1 7/16 inch
Main venturi 1¼ inch

Float Setting Top of float 5/64 inch below top surface of carbureter body casting Plus or minus 1/64 inch

Vents Outside none Inside balance vent 218 inch diameter

Gasoline Intake Needle Triangular horizontal No 44 (086) inch drill in needle seat

Idle Orifice Tube Jet size 031 inch diameter
Idle passage air bleed (in body) size 067 inch diameter
Restriction in body size 051 to 052 inch diameter

Idle Ports Upper port keyhole type length 180 inch width 032 inch 061 inch diameter hole at top Top of port located 128 to 132 inch above top of valve
Lower port size 053 to 057 inch diameter (For idle adjustment screw)

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 550 600 r p m

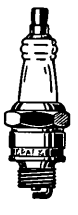
Main Metering Jet Calibrated to flow 268 to 272 cc per minute (Do not gauge for size If in doubt replace with new part)

Main Vent Through diffuser (air bleed inside bowl) size 0315 inch drill

Main Vent Tube Side Holes 7—0197 inch drill side holes—one side spaced 3/16 inch apart First hole 5/16 inch from end
7—0197 inch drill side holes—opposite side spaced 3/16 inch apart First hole 13/32 inch from end
Bottom hole 1—0197 inch drill

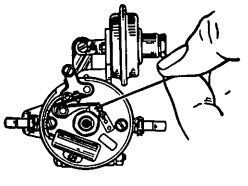
Step Up Jet 037 inch drill size

Accelerating Pump Type delayed action Stroke summer setting (inner hole short stroke) Intermediate setting (center hole) Winter setting (outer hole long stroke) Pump intake passage ball check seat size 115 to 120 inch diameter
Pump discharge passage restriction (under ball check) size 062 to 065 inch diameter in body
Pump (discharge) jet size 0315 inch



Pump Adjustment 32/64 inch plunger travel with pump link in medium stroke hole

Choke Butterfly type with poppet valve



Vacuum Spark Port 099 to 101 inch diameter Top of port 070 to 076 inch above top edge of valve

Motor Tune-Up—Be Accurate!

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level Wear on lip of float lever will raise float level Before adjusting float, be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 550-600 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble remove idle orifice tube and plug assembly Clean tube and passages with compressed air

If acceleration is not satisfactory, remove pump jet and clean with compressed air However it is usually advisable to replace the pump jet as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump sedi-

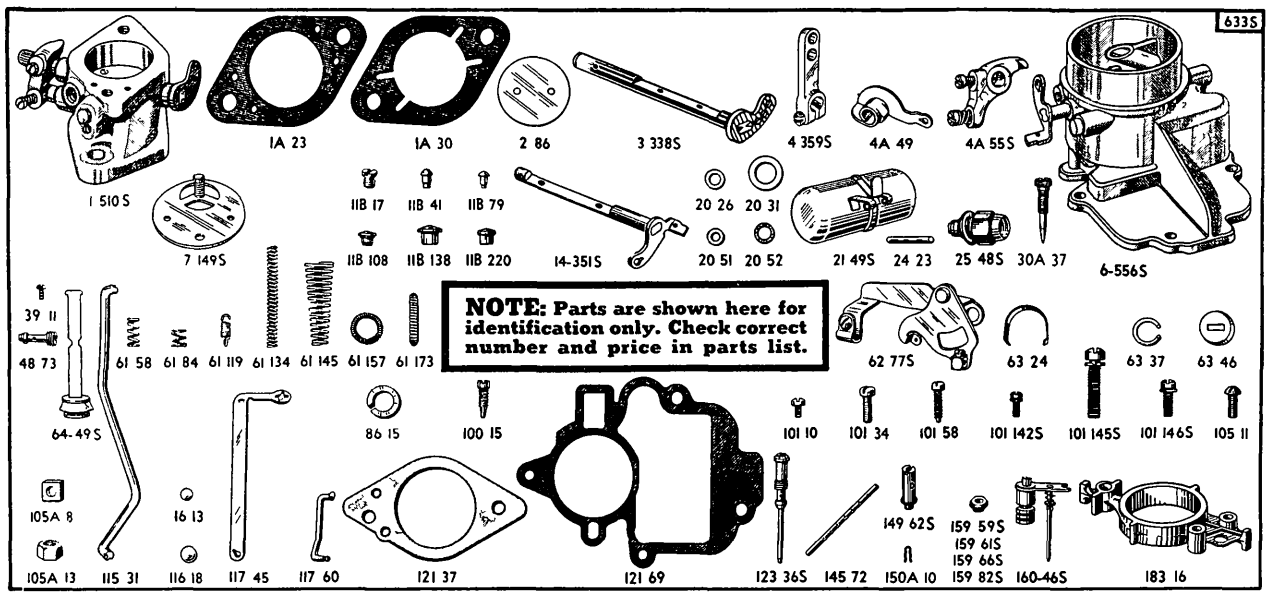
CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.



ment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a 'balance tube in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43, main vent tube can be removed and a new tube inserted with tool No T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation

Pump Adjustment: Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in center hole (medium stroke of throttle shaft arm) Place base of pump travel gauge T109-117S on upper edge of body casting at pump cylinder With throttle valve seated, turn gauge until projecting finger contacts top of plunger shaft Note number indicated on gauge Repcat with throttle valve wide open and plunger pressed to bottom of the cylinder The difference between the numbers indicated at wide open and closed throttle positions should be "32 (32/64') pump stroke Adjust by bending horizontal portion of pump lifter link

Pump stroke is adjustable for high or low temperature Set to longest stroke (outer hole) for cold weather, shorter stroke (inner hole) for hot weather driving

CARBURETER SPECIFICATIONS

For Studebaker Six Cylinder Engine, 3 Inch Bore, 4 Inch Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1¼ inch I. D.

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover, when needle is seated, to be ⅜ inch.

Vents: Outside, No. 10 drill. Inside, none.

Gasoline Intake: Square vertical needle. Size No. 46 drill hole in needle seat.

Low Speed Jet Tube: Jet size, .02925 inch diameter.
By-pass, size No. 54 drill.
Economizer, .059-.060 inch diameter.
Idle bleed, size No. 55 drill.

Idle Port: Length, .165 inch; width, .030 inch.

Idle Port Opening: Top of port: .112-.116 inch above top edge of valve with valve tight closed.

Idle Screw Seat: No. 46 drill.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Do not idle engine below 525-575 r.p.m.

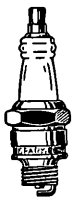
Main Nozzle: In primary venturi, angle 45°. Closed tip.
Inside diameter No. 30 drill.
Upper hole: .035 inch diameter on 45° angle.
Lower hole: .089 inch diameter on 60° angle.

Metering Rod (Vacumeter Type): Economy step, .072 inch diameter; middle step tapers to .061 inch diameter; power step .042 inch diameter. Length 3-9/64 inches.

Metering Rod Jet: .095 inch diameter.

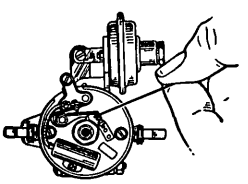
Metering Rod Setting: Use gauge, part No. T109-102 (2.468 inches).

Accelerating Pump: Pressure type (spring operated lever) with non-adjustable stroke.
Pump discharge jet, size No. 73 drill.
Relief passage (to outside), size No. 42 drill.
Intake ball check seat, size No. 40 drill.
Discharge ball check seat, size No. 32 drill.



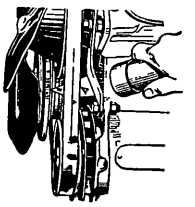
Pump Adjustment: 14/64 inch plunger travel full throttle position. Use gauge No. T109-117S.

Choke: Carter Climatic® Control (early production) 170P-77S set at index; (late production) 170U-61S, set one point lean. Butterfly type, offset valve. Choke heat suction hole in body size No. 36 (.1065") drill.

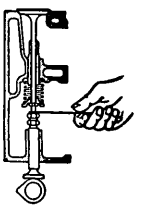


Vacuum Spark Port: .1005 to .1025 inch diameter. Top of port .060 to .070 inch above top edge of valve.

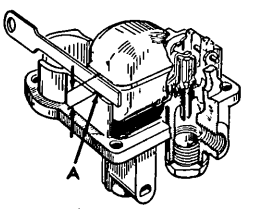
Motor Tune-Up—Be Accurate!



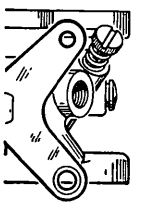
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .025"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open 2° B. T. D. C.

Valve Setting Cold
Intake .016"
Exhaust .016"

Float Setting (Use Gauge) ⅜ Inch (Measure from point "A" to top of float seam)

Idle Adjustment Screw Setting ½ to 1½ Turns Open

CARBURETER ADJUSTMENTS

Pump Adjustment: With throttle lever set screw backed out and throttle valve seated, place universal pump travel gauge T109-117S on bowl cover with lip of gauge extending over plunger shaft. Hold gauge vertical. The difference between closed and wide open throttle reading at index mark should be 14/64 inch plunger travel.

Adjust by bending throttle connector rod at lower angle.

Metering Rod Adjustment: Metering rod adjustment must be made after pump adjustment or when leaner than standard rods are installed. With throttle lever set screw backed out and throttle valves seated, insert gauge T109-102 in place of metering rod. Press down on metering rod arm until upper lip of arm contacts pin in pump arm. There should now be less than .005 inch between pin and notch in gauge.

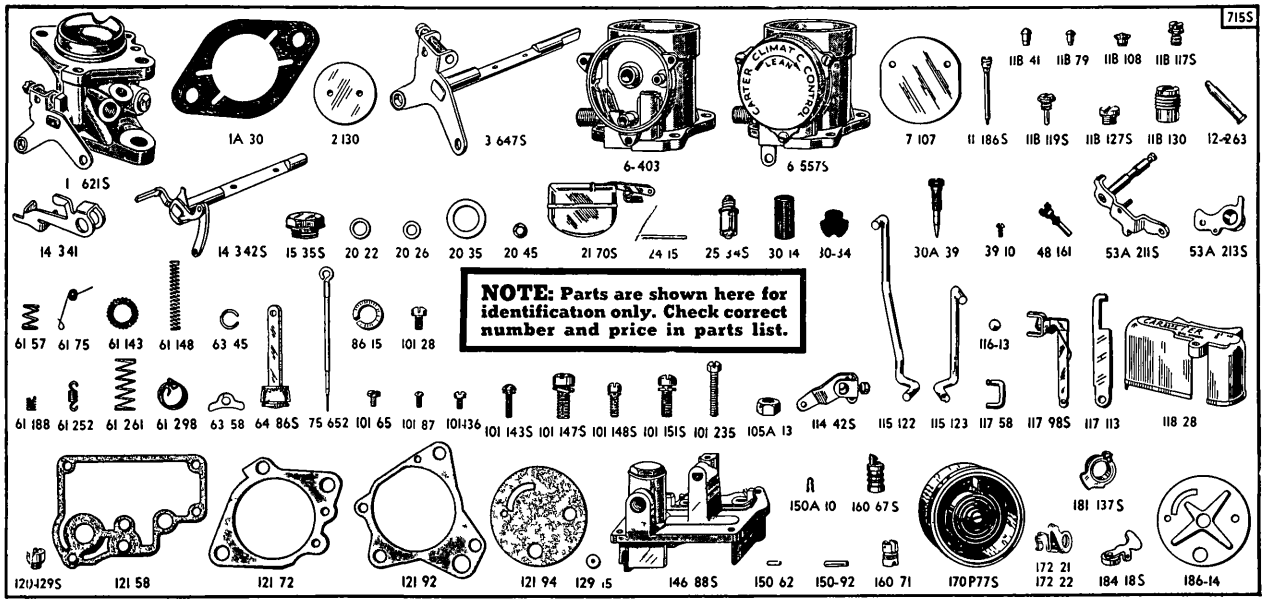
PRINTED IN U.S.A.

Adjust by bending upper lip on metering rod arm

After adjusting upper lip of metering rod arm, it is necessary to adjust the lower lip Procedure is as follows Press down on metering rod arm until upper lip contacts pin in pump arm Adjust lower lip for 3/16 inch clearance between pin in pump arm and upper surface of lower lip

Anti-Percolator Adjustment Crack throttle valve 030 inch by placing gauge T109-29 between throttle valve and bore of carbureter, side opposite idle port There should now be 025 inch (T109-189 may be used) clearance between rocker arm lip and pump arm



Adjust by bending rocker arm, use T109-105

Fast Idle Adjustment With thermostatic coil housing, gasket and baffle plate removed, crack throttle valve and hold choke valve closed Then close throttle There should now be 046 inch (T109-158 may be used) between throttle valve and bore of carbureter

Adjust by bending choke connector rod at lower angle, use T109-41

Unloader Adjustment Must be made after fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing There should now be 3/16" between lower edge of choke valve and inner wall of air horn

Adjust by bending arm on choke trip lever (use tool T109-187)

Studebaker Champion—1949-1952—Carbureter No. 715S

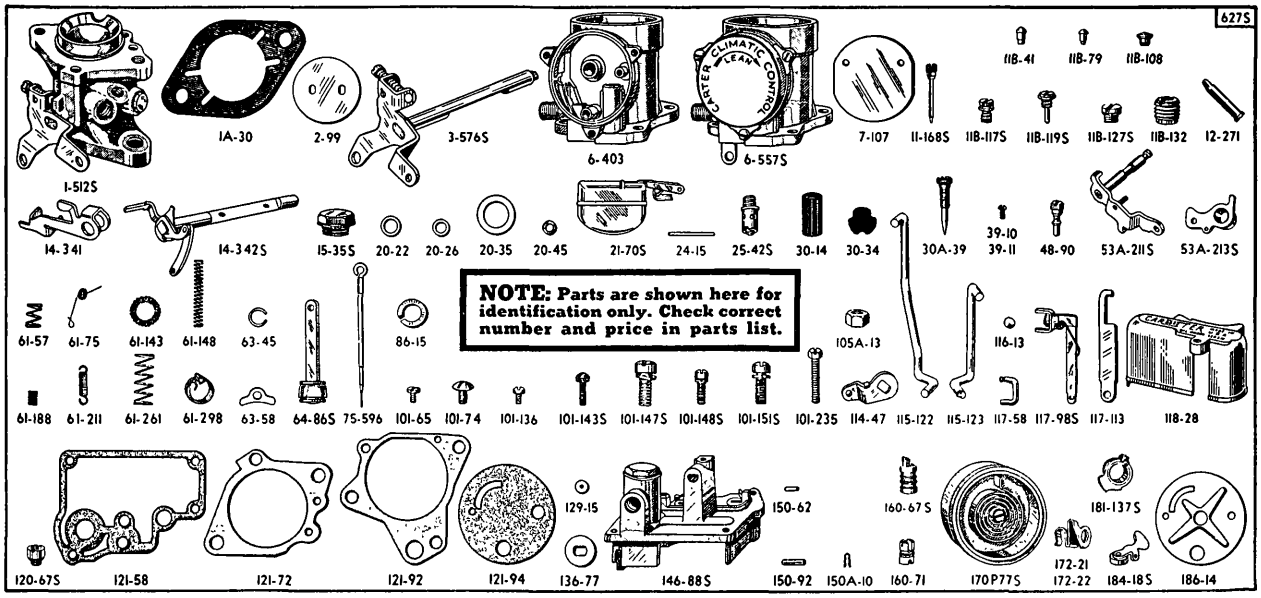
until upper lip of arm contacts pin in pump arm. There should now be less than .005 inch between pin and notch in gauge.

Adjust by bending upper lip on metering rod arm.

After adjusting upper lip of metering rod arm, it is necessary to adjust the lower lip. Procedure is as follows: Press down on metering rod arm until upper lip contacts pin in pump arm. Adjust lower lip for 3/16 inch clearance between pin in pump arm and upper surface of lower lip.

Anti-Percolator Adjustment: Crack throttle valve .030 inch by placing gauge T109-29 between throttle valve and bore of carbureter, side opposite idle port. There should now be .005 inch to .015 inch clearance between rocker arm lip and pump arm.



Adjust by bending rocker arm.

Fast Idle Adjustment: With thermostatic coil housing, gasket and baffle plate removed, crack throttle valve and hold choke valve closed. Then close throttle. There should now be .054 inch (T109-193) between throttle valve and bore of carbureter.

Adjust by bending choke connector rod at lower angle.

Unloader Adjustment: Must be made after fast idle adjustment. Hold throttle valve wide open and close choke valve as far as possible without forcing. There should now be 17/64 inch between lower edge of choke valve and inner wall of air horn.

Adjust by bending arm on choke trip lever (use Tool T109-187).

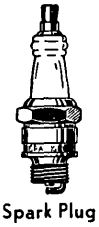
1—No 70 (028 inch) (712 mm) diameter 1 1/2 inch (38 10 mm) from end
1—No 68 (031 inch) (812 mm) diameter 1 39/64 inch (40 88 mm) from end
1—No 68 (031 inch) (812 mm) diameter 1 11/16 inch (42 86 mm) from end

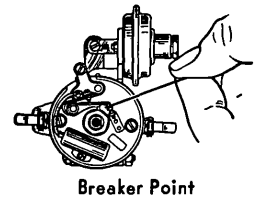
Step up Jet 0394 inch (1 00 mm) drill size

Accelerating Pump Type delayed action Stroke summer setting (inner hole short stroke) Intermediate setting (center hole) Winter setting (outer hole long stroke) Pump intake passage ball check seat size 115 to 120 inch (2 92 to 3 05 mm) diameter
Pump discharge passage restriction (under ball check) size 062 to 065 inch (1 58 to 1 65 mm) diameter in body
Pump (discharge) jet size 0236 inch (60 mm)



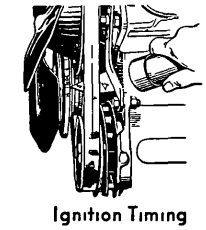
Pump Adjustment 38/64 inch plunger travel with pump link in medium stroke hole

Choke Butterfly type with poppet valve

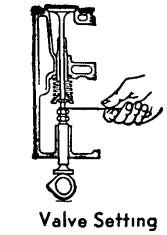


Vacuum Spark Port Horizontal slot type size 040 by 110 (1 016 by 2 794 mm) Top of port 035 to 041 inch (89 to 1 04 mm) above top edge of valve

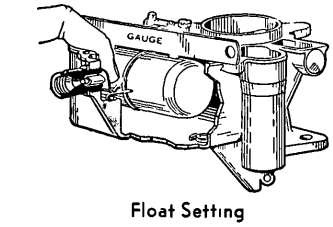
Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



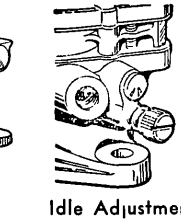
CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap 025"



Breaker Point Setting 020"



Ignition Timing Breaker Points to Open 2° B T D C

Valve Setting (Cold) Int & Exh 016"

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting 1/2 to 1 Turns Open

CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service, check float level Wear on lip of float lever will raise float level Before adjusting float be sure float lever pin is firmly seated Reset float level by bending lip of float lever away from needle to raise level or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 400 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble remove idle orifice tube and plug assembly Clean tube and passages with compressed air

If acceleration is not satisfactory, remove pump jet and clean with compressed air However it is usually advisable to replace the pump jet as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump sediment in pump cylinder or clogged intake ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder use care in installing to avoid damage to plunger leather

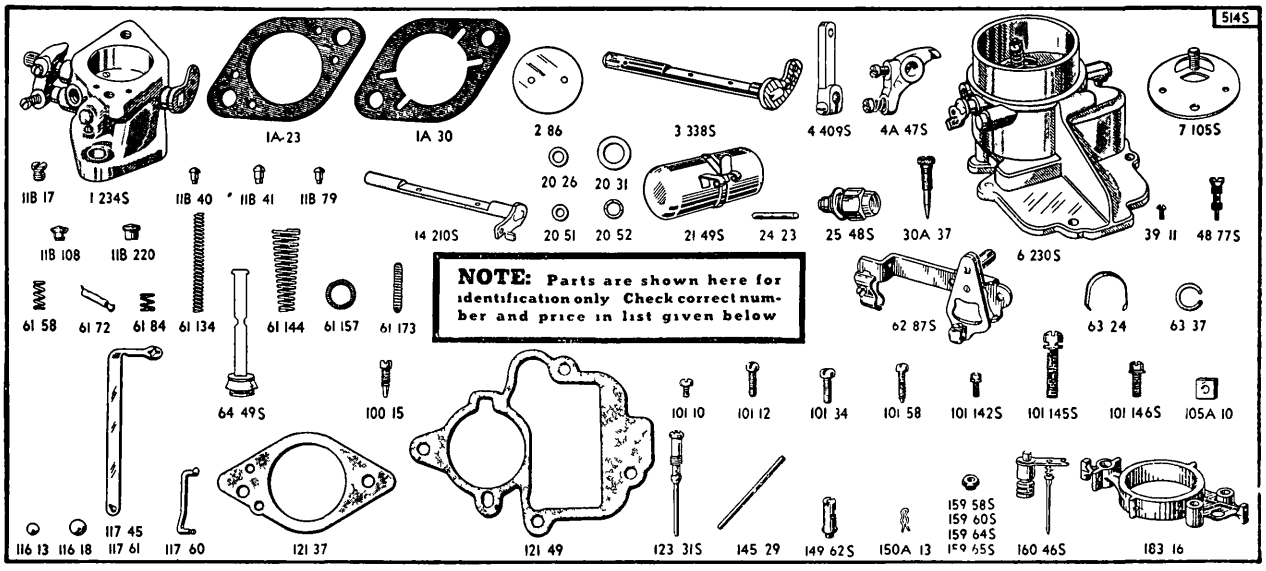
CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U S A

Correct air fuel ratio is provided by a "balance tube" in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged, the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of rivet plug beneath float bowl with tool No T109-43 main vent tube can be removed and a new tube inserted with tool No. T109-195 Care must be exercised in inserting new tube which must seat tightly Use new rivet to complete the installation



Pump adjustment Remove air horn assembly, back out throttle adjustment screw, and place pump operating link in center hole of throttle shaft arm Adjustment can be made by bending horizontal portion of pump connector link, so that top of pump plunger shaft contacts lip of indicator on pump stroke gauge T109-117S Correct travel is 38/64"

Pump stroke adjustable for high or low temperature Set to longest stroke for cold weather, shorter stroke for hot weather driving

Maximum economy and performance are secured only when breaker points, spark plugs, valves and motor timing are set to manufacturer's specifications After motor is properly tuned, the following should also be done to insure satisfactory performance and economy

(a) Float level must be set as above
(b) Step-up rod in step-up jet must seat and move freely When reassembling, jet must be screwed in tight against seat
(c) Step-up piston in body casting should not bind and must be free of dirt
(d) Main metering jet can be replaced with leaner than standard metering jets for altitude

Caution Do not attempt to gauge metering jets with drills These jets have been flow-tested to insure correct fuel flow

WE Down-Draft **Carbureters 532S-661S** With Climatic® Control

CARBURETER SPECIFICATIONS

For Studebaker Six Cylinder Engine: 3 Inch Bore, 4 Inch Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1-3/16 inch I. D.

Float Level: Distance from seam of float (at free end) to tip on lower edge of float chamber cover, when needle is seated to be ¼ inch (532S), ⅜ inch (661S).

Vents: Outside, No. 10 drill. Inside, none.

Gasoline Intake: Square vertical needle. Size No. 46 drill hole in needle seat.

Low Speed Jet Tube: Jet size, .036 inch.
By-pass, size No. 50 drill.
Economizer, .0755-.0765 inch diameter.
Idle bleed, size No. 50 drill.

Idle Port: Length, .200 inch; width, .030 inch.

Idle Port Opening: .010 to .014 inch below lower edge of valve with valve closed tight.

Idle Screw Seat: No. 46 drill.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Do not attempt to idle engine below 8 m.p.h.

Main Nozzle: In primary venturi, angle 45°. Angled tip. Inside diameter No. 30 drill.
Discharge jet size, .086 inch.

Metering Rod: (Vacumeter Type) Economy step, .068 inch diameter; middle step tapers to .060 inch diameter; power step .043 inch diameter. Length 3-9/64 inches.

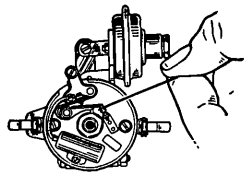
Metering Rod Jet: .098 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-102 (2.468 inches).

Accelerating Pump: High pressure type (spring operated lever) with non-adjustable stroke.
Pump discharge jet, size No. 71 drill.
Relief passage (to outside), size No. 42 drill.
Intake ball check seat, size No. 40 drill.
Discharge ball check seat, size No. 32 drill.

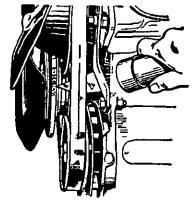
Pump Adjustment: 17/64 inch plunger travel full throttle position. Use gauge No. T109-117S

Choke: Carter Climatic® Control, (532S) set at index, (661S) set one point lean. Butterfly type, offset valve.
Choke heat suction hole, in body, (532S) size No. 28 (.1405") drill, (661S) size No. 36 (.1065") drill.

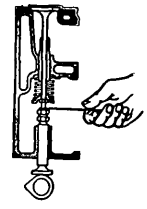


Vacuum Spark Port: .1005 to .1025 inch diameter. Top of port .055-.065 inch above top edge of valve.

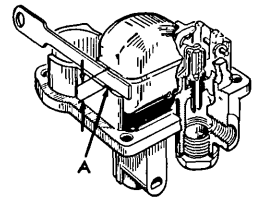
Motor Tune-Up—Be Accurate!



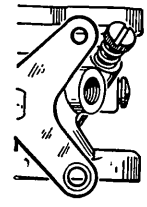
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .025"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open 2° B. T. D. C.

Valve Setting Cold
Intake .016"
Exhaust .016"

Float Setting (Use Gauge)
¼ Inch (532S)
⅜ Inch (661S)
(Measure from point "A" to top of float seam)

THE CARTER CLIMATIC® CONTROL
WE CARBURETER

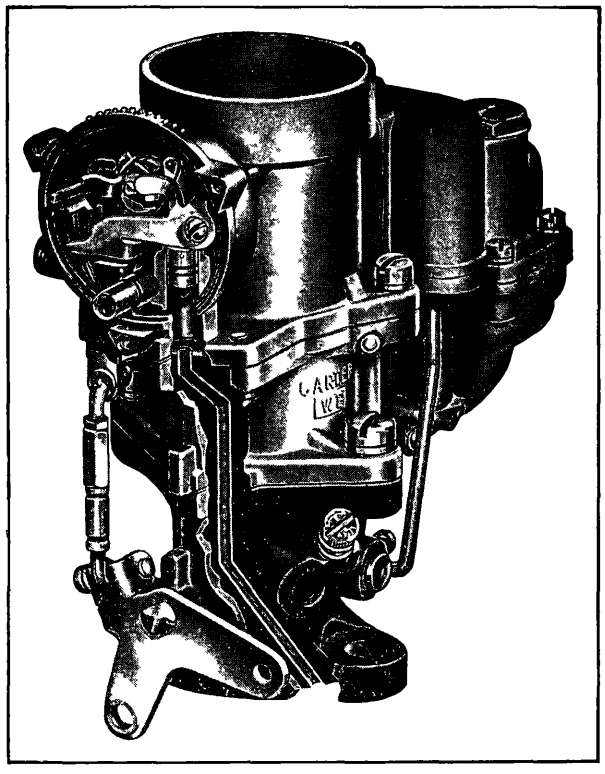

Figure 1

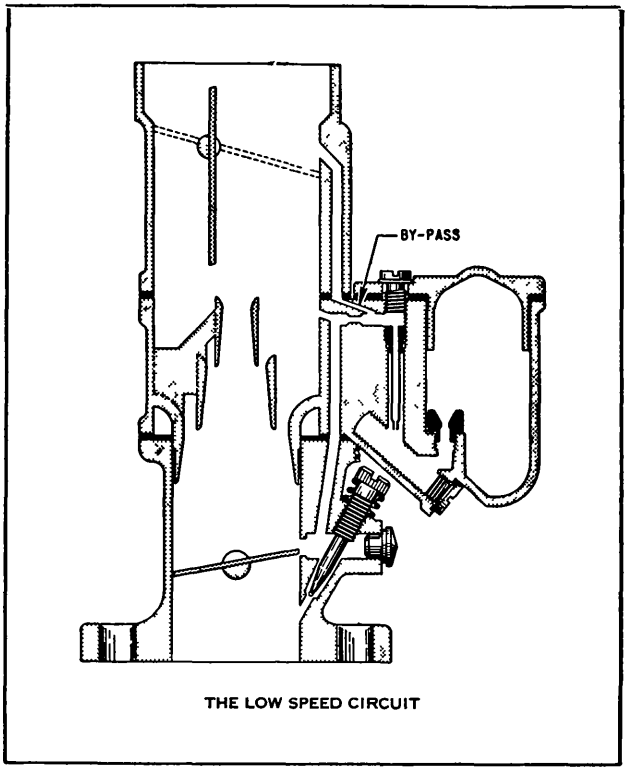

Figure 2

The Carter WE Carbureter is essentially the same as the Carter WA-1. However, there are several changes in the location of parts in the climatic control mechanism. The fast idle cam assembly, choke trip lever, unloader mechanism, etc., are located in the Climatic® control housing In this way all these parts are protected from dirt and other foreign matter (Fig 1)

The by-pass of the low speed circuit is extended to a point above the closed choke valve. This produces a more uniform mixture for part throttle operation while the choke is closed or partly closed. Check to see that the air horn gasket does not leak at this point and the calibrated hole in the upper surface of the body is clean

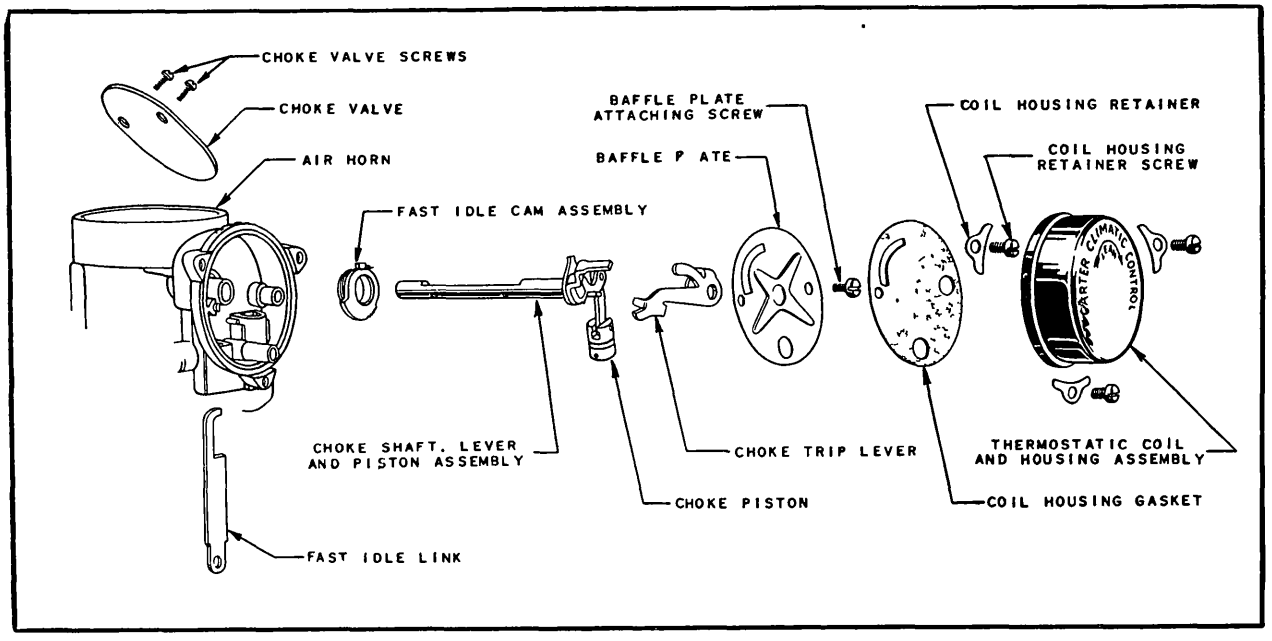

Figure 3

CLIMATIC® CONTROL ASSEMBLY

Slide fast idle cam assembly onto choke shaft. Install choke shaft into air horn and revolve cam to allow piston to slide freely into cylinder. Then lock fast idle cam spring ends around **nib of cam** and **projecting nib of choke shaft assembly.**

Install choke valve with trademark to top, seating valve before tightening screws. Valve must not bind in any position, but fall free of its own weight. Install fast idle link and choke trip lever. Place washer on choke connector rod assembly before attaching to fast idle link. Install spring and retainer.

Fast idle and unloader adjustments should be made at this point before the balance of climatic control is assembled. (Fig. 4)

Install baffle plate and attaching screw. Install coil housing gasket. With choke wide open, hold coil housing with notch revolved one-quarter turn clockwise from index mark on housing. Place against housing and revolve counter clockwise to center index mark (532S), one point lean (661S) Lock in place with screws and retainer.

CARBURETER ADJUSTMENTS

FLOAT SETTING:

With bowl cover inverted and float lip resting on seated needle, distance from soldered seam of float to small projection on machined surface of bowl cover should be 1/4" (532S), 3/8" (661S). Adjustment should be made by bending lip of float lever.

After making float adjustment, adjust stops on float bracket so free end of float can move 1/2" plus or minus 1/32".

PUMP ADJUSTMENT:

Good acceleration is dependent primarily on the amount of gasoline discharged through the pump jet. This quantity of pump discharge is controlled by the distance the pump plunger travels. Pump travel adjustment should be made each time the carbureter is serviced and must be made before metering rod or anti-percolator settings. Procedure is as follows:

(1) Back out throttle lever adjusting screw to allow throttle valve to seat in bore of carbureter.

(2) Place pump travel gauge (tool T109-117S) on bowl cover with lip of gauge extending over top of plunger shaft

(3) Turn knurled nut of gauge until lip rests on top of plunger shaft, **with throttle valve seated.** Read number on gauge indicated by notch in knurled nut.

(4) Repeat operation number 3 with throttle valve wide open.

(5) The difference in the readings obtained at closed and at wide open throttle should be "17" (17/64"). ADJUSTMENT IS MADE BY BENDING THROTTLE CONNECTOR ROD AT LOWER ANGLE.

METERING ROD ADJUSTMENT:

Correct setting of metering rod is important and must be made when reassembling carbureter or when leaner than standard **rods are installed** DO NOT DISTURB PUMP ADJUSTMENT.

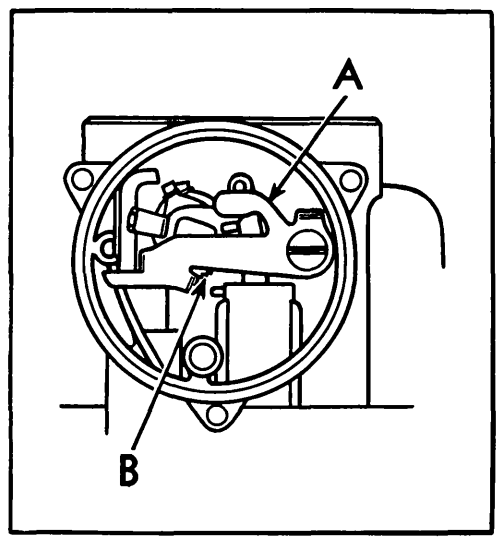
Remove metering rod and disc, and install gauge T109-102 in place of metering rod, making sure lower end of gauge seats in metering rod jet. Back out throttle lever set screw so throttle valve seats in bore of carbureter. (Make sure fast idle cam does not hold throttle open. Throttle valve **must** be seated.) Press lightly on top of metering rod arm until **upper** lip of arm contacts pin in pump arm. There should be less than .005" clearance between shoulder in notch of gauge and metering rod pin. Adjust by bending upper lip on metering rod arm. Use tool T109-105.

This carbureter provides an added economy measure by means of the second lip on metering rod arm which extends **below** pin in pump arm and should be adjusted as follows:

With throttle valve seated and finger pressing down on metering rod arm so that upper lip contacts pin on pump arm, adjust lower lip for 3/16" clearance between **bottom** of pump arm pin and **upper** surface of lower lip (use gauge T109-28).

ANTI-PERCOLATOR ADJUSTMENT:

Do not disturb pump or metering rod adjustments. Insert .030" gauge (T109-29) between throttle valve and bore of carbureter, side opposite idle port. Bend anti-percolator rocker arm to allow .005"-.015" clearance between rocker arm lip and pump arm.



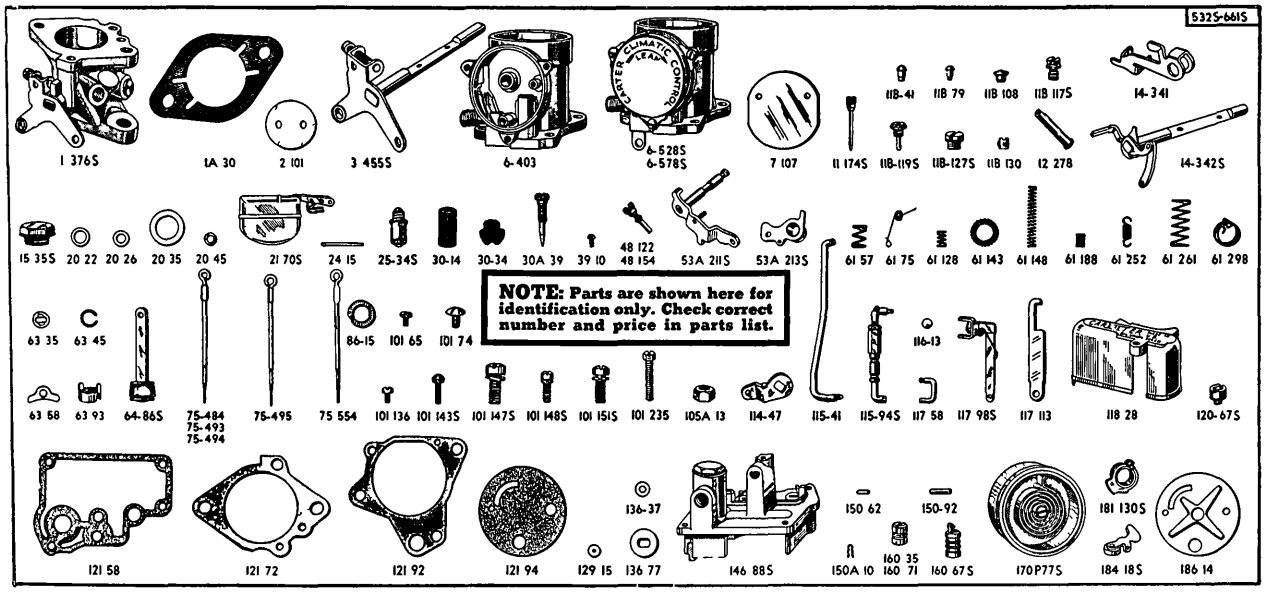


Figure 4

FAST IDLE ADJUSTMENT:

Remove thermostatic coil housing, gasket, and baffle plate. Crack throttle valve, and hold choke valve fully closed, then close throttle. This will allow fast idle cam to revolve to fast idle position ("B"—Fig. 4). With choke valve held tightly closed and slight tension on throttle lever, loosen lock nut on choke connector rod assembly and turn sleeve until there is .054" (gauge T109-193) clearance between throttle valve and bore of carbureter, side opposite idle port. Hold sleeve in position and secure lock nut.

UNLOADER ADJUSTMENT must be made after fast idle adjustment. Hold throttle valve in wide open position and close choke valve as far as possible without forcing. There should be 3/16" clearance between lower edge of choke valve and inner wall of carbureter (gauge T109-28). Adjust by bending arm on choke trip lever ("A"—Fig. 4), use tool T109-187.

Studebaker 1946-47-48—Carbureter Nos. 532S-661S

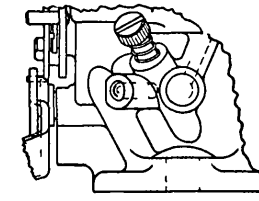
Set Breaker Points 020"



Use Timing Light Breaker Points to Open 2° B T D C

Set Valves COLD
Intake 016"
Exhaust 016"

Correct Float Level (Measure from machined surface of small projection to top of seam) 5/16 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

BRIEF CARBURETER ADJUSTMENTS

Pump Adjustment With throttle valve seated and connector link in place pump plunger should travel 11/64" from closed to wide open position Adjustment should be made by bending throttle connector rod at lower angle Pump travel can be measured by using universal pump stroke gauge T109-117S by placing base of gauge on ridged portions of bowl cover so that projecting portion of pump gauge rests on top surface of connector link at pump shaft Hold gauge vertical The difference between the number shown by index mark on gauge at wide open and closed positions should be 11

Metering Rod Adjustment Correct setting of metering rod is important and must be made after pump adjustment Insert gauge (tool No T109-102) in place of metering rod, seating tapered end in metering rod jet Hold gauge vertical to insure seating With throttle valve seated, press down lightly on piston link directly over piston There should be less than 005 clearance between metering rod pin and shoulder in notch of gauge Gauge must not drag on pin Adjustment can be made by bending lip on piston link so that it contacts pump arm (Use tool T109 105) Remove

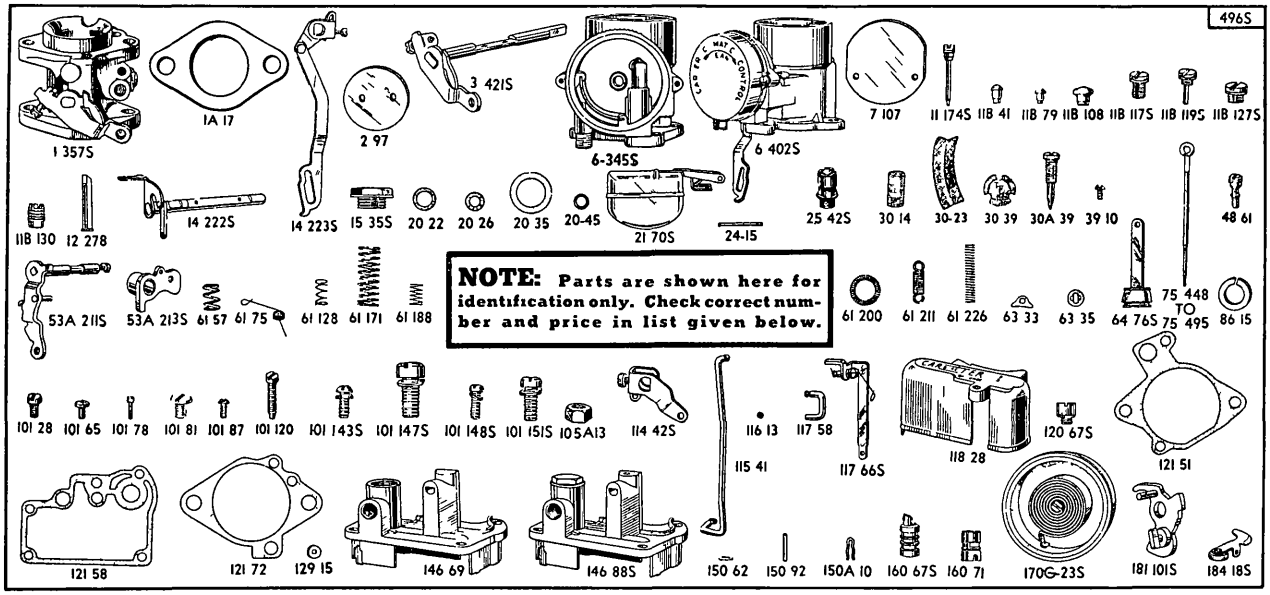
CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

gauge and install metering rod and disk Connect metering rod and spring

Anti-Percolator Adjustment: Crack throttle valve .030" by placing gauge T109-29 between valve and bore of carbureter (side opposite port) Bend rocker arm (use tool T109-105) until there is a clearance of .005" to .015" between rocker arm and pump arm



Fast Idle Adjustment. With fast idle cam held in normal idle position, tighten throttle lever adjusting screw until it just seats against cam Hold throttle lever closed and pull cam back until first (or lower) step on cam is against (not on) set screw

There should now be 5/8" clearance between inside wall of air horn and lower edge of choke valve (Use tool T109-85)

Adjustment can be made by bending at offset portion of fast idle link. (Use tool T109-41.)

Unloader Adjustment: With throttle valve wide open there should be 1/4" clearance between lower edge of choke valve and inner wall of air horn (Use tool T109-31) Adjustment should be made by bending cam on throttle lever (Use tool T109-41.)

Lock-Out Adjustment: With throttle and choke valves wide open, choke should lock in wide open position Adjustment should be made by bending lip at lower end of fast idle link to give 1/32" clearance between lip and throttle lever lock, with throttle and choke valves held wide open (Use tool T109-105)

Studebaker Champion—1941-42 and 1945—Carbureter No. 496S

, WA-1 Down-Draft **Carbureter 496S** With Climatic® Control

CARBURETER SPECIFICATIONS

For Studebaker Six Cylinder Engine 3 Inch Bore 4 Inch Stroke

Dimensions Flange size 1¼ inch S A E
Primary venturi 11/32 inch I D
Secondary venturi 11/16 inch I D
Main venturi 1 3/16 inch I D

Float Level Distance from seam of float (at free end) to tip on lower edge of float chamber cover when needle is seated to be 5/16 inch

Vents Outside No 10 drill Inside none

Gasoline Intake Square vertical needle Size No 38 drill hole in needle seat

Low Speed Jet Tube Jet size No 64 drill
By pass size No 50 drill
Economizer 0755 0765 inch diameter
Idle bleed size No 50 drill

Idle Port Length 200 inch width 030 inch

Idle Port Opening 010 to 014 inch below lower edge of valve with valve closed tight

Idle Screw Seat No 46 drill

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out Do not attempt to idle engine below 8 m p h

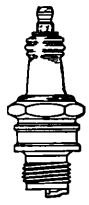
Main Nozzle In primary venturi angle 45° Angled tip In side diameter No 30 drill
Discharge jet size No 44 drill

Metering Rod (Vacumeter Type) Economy step 068 inch diameter middle step tapers to 060 inch diameter power step 043 inch diameter Length 3 9/64 inches

Metering Rod Jet 098 inch diameter

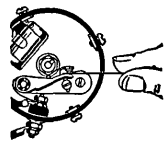
Metering Rod Setting Use gauge part No T109 102 (2 468 inches)

Accelerating Pump High pressure type (spring operated lever) with non adjustable stroke
Pump discharge jet size No 72 drill
Relief passage (to outside) size No 42 drill
Intake ball check size No 62 drill
Discharge ball check size No 32 drill



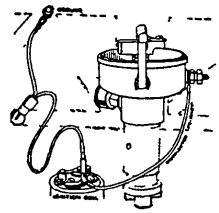
Pump Adjustment 11/64 inch plunger travel full throttle position Use gauge No T109 117S

Choke Carter Climatic® Control set one point lean Butterfly type offset valve
Choke heat suction hole in body size No 28 (1405") drill

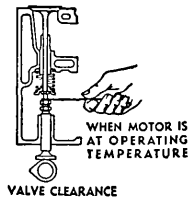


Vacuum Spark Port 1005 to 1025 inch diameter **Early Production** Top of port 045 to 050 inch above top edge of valve **Late Production** Top of port 055 to 060 inch above top edge of valve

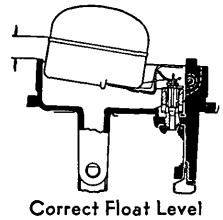
Motor Tune-Up—Be Accurate!



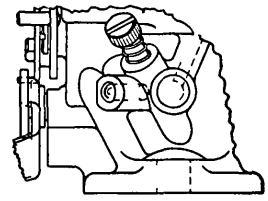
CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter



Spark Plug Gap 025"



Set Breaker Points 020"



Use Timing Light Breaker Points to Open 2° B T D C

Set Valves COLD
Intake 016"
Exhaust 016"

Correct Float Level (Measure from machined surface of small projection to top of seam) 5/16 Inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

BRIEF CARBURETER ADJUSTMENTS

Pump Adjustment With throttle valve seated and connector link in place pump plunger should travel 11/64" from closed to wide open position Adjustment should be made by bending throttle connector rod at lower angle Pump travel can be measured by using universal pump stroke gauge T109-117S by placing base of gauge on ridged portions of bowl cover so that projecting portion of pump gauge rests on top surface of connector link at pump shaft Hold gauge vertical The difference between the number shown by index mark on gauge at wide open and closed positions should be 1

Metering Rod Adjustment Correct setting of metering rod is important and must be made after pump adjustment Insert gauge (tool No T109-102) in place of metering rod, seating tapered end in metering rod jet Hold gauge vertical to insure seating With throttle valve seated, press down lightly on piston link directly over piston There should be less than 005 clearance between metering rod pin and shoulder in notch of gauge Gauge must not drag on pin Adjustment can be made by bending lip on piston link so that it contacts pump arm (Use tool T109 105) Remove

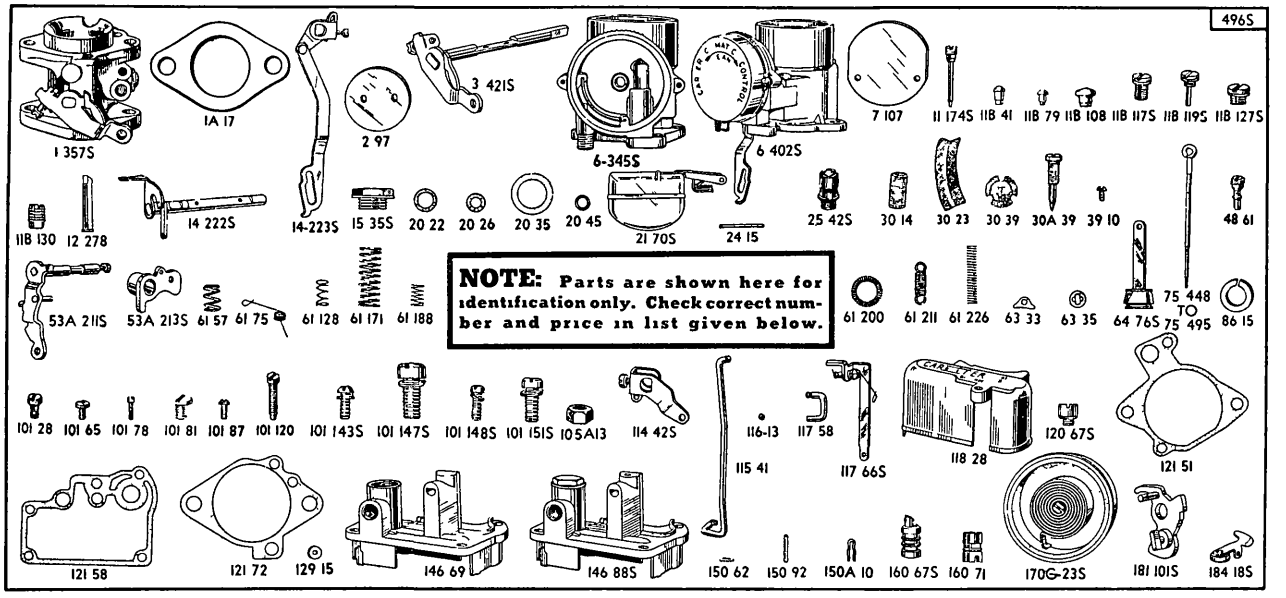
CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

gauge and install metering rod and disk Connect metering rod and spring

Anti-Percolator Adjustment Crack throttle valve 030" by placing gauge T109-29 between valve and bore of carbureter (side opposite port) Bend rocker arm (use tool T109-105) until there is a clearance of 005" to 015" between rocker arm and pump arm



Fast Idle Adjustment With fast idle cam held in normal idle position, tighten throttle lever adjusting screw until it just seats against cam Hold throttle lever closed and pull cam back until first (or lower) step on cam is against (not on) set screw

There should now be 5/8" clearance between inside wall of air horn and lower edge of choke valve (Use tool T109-85)

Adjustment can be made by bending at offset portion of fast idle link (Use tool T109-41)

Unloader Adjustment: With throttle valve wide open there should be 1/4" clearance between lower edge of choke valve and inner wall of air horn (Use tool T109-31) Adjustment should be made by bending cam on throttle lever (Use tool T109-41)

Lock-Out Adjustment With throttle and choke valves wide open, choke should lock in wide open position Adjustment should be made by bending lip at lower end of fast idle link to give 1/32" clearance between lip and throttle lever lock, with throttle and choke valves held wide open (Use tool T109-105)

Studebaker Champion—1941-42 and 1945—Carbureter No. 496S

WHEN SERVICING, USE GASKET ASSORTMENT No. 159A, REPAIR PACKAGE No. 1301A

WHIZZER MODEL J

WHIZZER MOTOR BIKE 1948-1951

(N-704S can be used in place of N-703S)

Horizontal, Model N Type, **Carbureter Nos. N-703S, N-704S**

CARBURETER SPECIFICATIONS

For Whizzer I Cylinder Engine: 2¼" Bore, 2⅛" Stroke

Dimensions: Flange size: ½ S. A. E. (Special). Main Venturi size 7/16 inch.

Float Level: Distance from top of float (at free end) opposite needle seat to lower edge of float chamber cover when needle is seated to be 13/64 inch.

Vents: Inside—none. Outside—No. 50 (.070") drill.

Gasoline Intake: Square vertical needle, seat size No. 48 (.076") drill. Intake fuel restriction (in needle seat), size No. 65 (.035") drill.

Low Speed Jet Tube: Jet size No. 70 (.028") drill.
Auxiliary jets: (idle bleed) in side of tube, 4 No. 70 (.028") drill.

Idle Port: Slot type, length .080 inch, width .030 inch.
Idle port opening—Bottom of port to be .0 to .004" above top edge of valve.
Idle adjustment screw seat, size .051" drill.

Set Idle Adjustment Screw: 1 to 3 turns open. For richer mixture turn screw out. Do not idle engine below 1,000 r.p.m.

Main Nozzle: Accelerating jets 4—No. 62 (.038") drill in sid of nozzle, (in nozzle well.)
Nozzle passage: (nozzle well to air horn) No. 35 (.110") drill.

High Speed Adjusting Needle: Seat (in base of nozzle) siz : .040 inch diameter.

Choke: Manual—butterfly type.

Spark Plug Gap	Magneto Air Gap	Breaker Point Setting:	Ignition Timing Breaker Points to Open:	Valve Setting (Cold)	Float Setting	Idle Adjustment Screw Setting
.023"-.025"	.012"-.015"	On Light	30° B. T. D. C.	Int. and Exh. .012"	13/64"	1 to 3 Turns Open

SERVICE PROCEDURE

To Disassemble

1. Remove carbureter from engine.
2. Remove bowl nut, gasket and bowl.
3. Remove float pin, float, needle and needle seat. Check float for dents, leaks, and wear on float lip or in float pin holes.
4. Remove bowl ring gasket.
5. Remove low speed jet and high speed needle assembly and spring.
6. Remove idle adjustment screw and spring.
7. Remove strainer nut and gasket assembly and strainer.
8. Remove nozzle.
9. Remove throttle valve screws, valve, and shaft and lever assembly.
10. Do not remove choke valve and shaft unless replacement of these parts is necessary. A spring loaded ball retains choke in wide open position. Be sure to use a new ball and spring when replacing choke shaft and lever assembly. CAUTION: **Hold a screw driver handle or a small piece of wood over threaded hole in air horn (side opposite choke lever) to prevent the ball from flying out when shaft is removed.**
11. Clean all parts in clean gasoline or solvent, making sure all carbon accumulation is removed from bore, especially where throttle valve seats in casting. Blow out all passages with compressed air. Replace all worn and damaged parts. Always use new gaskets.

To Assemble

12. Install throttle shaft and valve. Valve must be installed with trademark "c" on side toward idle port when viewing from flange side. Always use new screws. With valve screws loose and throttle lever set screw backed out, seat valve by tapping lightly with a small screw driver. Hold in place while tightening screws.
13. Install nozzle, making sure it seats in casting.
14. Install needle seat, needle, float and float pin.
15. Set float level. With carbureter casting inverted, float resting lightly against needle in its seat, there should be 13/64" clearance between machine surface of casting and free end of float (side opposite needle seat). Adjust by bending lip of float with small screw driver.
16. Install bowl ring gasket, bowl, bowl nut gasket and bowl nut. Tighten securely after making sure bowl is centered in gasket.
17. Install low speed jet and high speed needle assembly. Turn in until it seats in nozzle, then back out 2 full turns.
18. Install open end of strainer in strainer nut and gasket assembly and install strainer nut assembly.
19. Then install idle adjusting screw, finger tight. Back out 1 to 3 turns. DO NOT USE PLIERS OR SCREW DRIVER AS IT MAY DAMAGE IDLE SCREW.

HIGH SPEED AND IDLE SCREW ADJUSTMENT

After rebuilding and installation on engine is complete, the high speed and idle screw adjustments must be made.

The high speed needle should be adjusted for the leanest possible mixture which will allow satisfactory acceleration. With the high speed needle turned counter clockwise (from closed position) 2 full turns and idle screw turned 1 to 3 turns open, start engine.

Accelerate engine and check response. If the engine misses and backfires, the high speed mixture is too lean and the adjustment screw must be turned counter clockwise to correct this condition. If the engine loads (heavy exhaust) and is sluggish, the mixture is too rich and th adjustment screw must be turned clockwise to correct. To make final check of the high speed adjustment, operate the engine under load and adjust. The idle scr w should be adjust d intermittently whil making the high spe d adjustm nt. Th final idl adjustm nt should be made at approximately 1000-1200 r.p.m. until smoothest possible idle is obtained. This adjustment must not exceed the limits of 1 to 3 turns from closed position. **DO NOT USE EXCESSIVE FORCE ON THE HIGH SPEED NEEDLE OR IDLE SCREW AS DAMAGE MAY RESULT.**

CARBURETER ADJUSTMENTS

Float Adjustment With bowl cover assembly inverted and float resting on pin in seated needle and with gasket removed the distance from the bowl cover to the top of float should be 9/32 inch (Gauge T109 126) Do not depress float lip against spring loaded pin in needle but let float rest of its own weight Adjust by bending lip of float not float arm Float setting must be checked with the bowl cover held at eye height in a level position

Float Drop With bowl cover assembly held in upright position the d stance between free end of float and bowl cover should be 1¼ inches Adjust by bending stop tabs on float arm

Pump Adjustment This adjustment should be made before the meter ng rod adjustment and should be checked each time the carbureter s reassembled With throttle valve seated in the bore of carbureter press down on upper end of diaphragm shaft until it reaches its bottom pos tion (tool T109 212 may be

GENERAL BULLETIN

ALL CARBURETER ACCOUNTS

BULLETIN NO. 9 - WILLYS
DATE June 1, 1956

SUBJECT: ACCELERATION STUMBLE
YF-938SA CARBURETER

Willys four wheel drive vehicles CJ-3B, CJ-5 and CJ-6 are equipped with the YF-938SA carbureter. There have been reports of an acceleration stumble, just off idle, on some vehicles. This engine has a water heated intake manifold. It is important that the following be observed:

1. The water thermostat must operate at not less than 155°.
2. Ignition timing of 5° B.T.D.C., or road set for light detonation.
3. 600 RPM idle speed is a must.

All other points of engine tune-up should have careful attention.

Starting with production code date E-6, May 1956, all 938SA carbureters produced will have an enlarged pump discharge jet. The jet is a pressed-in part and should not be removed in service. A No. 68 drill (.031") may be used to enlarge the pump jet used prior to May production. This was No. 72 drill (.025") size. The larger jet allows a greater quantity of fuel to be discharged quickly upon acceleration.

1. Float level and metering rod adjustments are rather critical.
2. The accelerator discharge ball check must seat properly to obtain good performance.
3. Metering rod 75-913 (one step rich) may prove helpful in some areas where vehicles are used under unusual conditions.

YF Down-Draft Carbureters—**Nos. 938S-938SA**

CARBURETER SPECIFICATIONS

For Willys 4 Cylinder Engine: 3 1/8 Inch Bore, 4 3/8 Inch Stroke

Dimensions: Flange size, 1 1/4 inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1 1/4 inch I. D.

Float Setting: See Adjustments.

Vents: Outside, none. Inside balance vent to air horn, above choke valve.

Gasoline Intake: Spring loaded needle. Size No. 48 (.076 inch) drill in needle seat.

Low Speed Jet Tube: Jet, size No. 70 (.028 inch) drill. By-pass in air horn, size No. 56 (.0465 inch) drill. Economizer, size No. 54 (.055 inch) drill. Idle bleed, size No. 56 (.0465 inch) drill. Bleed, idle well to bowl (late production only), size No. 73 (.024 inch) drill.

Idle Port: Upper port, slot type, length .183 to .185 inch; width, .030 inch.

Idle Port Opening: Top of port .168 to .172 inch above top edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): Size .0615 to .0655 inch diameter.

Set Idle Adjustment Screw: 3/4 to 1 3/4 turns open. For richer mixture turn screw out. Do not idle engine below 600 r.p.m.

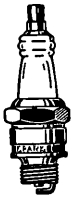
Main Nozzle: Nozzle is installed permanently. DO NOT REMOVE. Anti-percolator well vent (plug), size No. 74 (.0225 inch) drill.

Metering Rod (Diaphragm Type): Economy step .074 inch diameter. Middle step tapers to (938S) .068 inch; (938SA) .06775 inch diameter. Power step (938S) .056 inch, (938SA) .047 inch diameter.

Metering Rod Jet: (938S) Size No. 41 (.096 inch) drill. (938SA) Size .091 inch diameter.

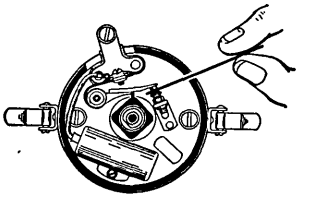
Metering Rod Setting: See Adjustments.

Accelerating Pump: Diaphragm type, vacuum and mechanically operated. Pump jet (938S and early 938SA), size No. 72 (.025 inch) drill; (late 938SA) size No. 68 (.031 inch) drill. Intake passage (in diaphragm housing), size No. 72 (.025 inch) drill. Discharge ball check seat (in body), size No. 42 (.0935 inch) drill. Vacuum restriction (in flange), size No. 55 (.052 inch) drill. Vacuum passage (diaphragm bleed), size No. 65 (.035 inch) drill.



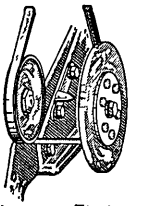
Pump Adjustment: None.

Choke: Manual, interconnected with throttle. Valve, offset butterfly type.

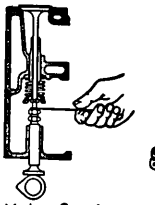


Vacuum Spark Port: .054 to .056 inch diameter. Top of port .035 to .045 inch above top edge of valve with valve tightly closed.

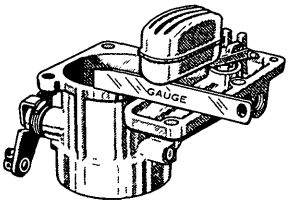
Motor Tune-Up—Be Accurate!



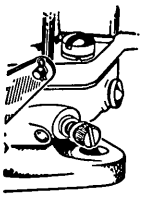
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: 5° B. T. C. at Crank Pulley (or Road Set for Light Detonation)

Valve Setting (Hot or Cold) Intake .018" Exhaust .016"

Float Setting 5/16 Inch (Use Gauge T109-107)

Idle Adjustment Screw Setting 3/4 to 1 3/4 Turns Open

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed, the distance from the bowl cover to the top of float should be 5/16 inch (gauge T109-107). Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight. Adjust by bending lip of float, not float arm. Float setting must be checked with the bowl cover held at eye height in a level position.

METERING ROD ADJUSTMENT: This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed. With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber. (Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod.) Metering rod should contact bottom of metering rod well and metering rod arm

CARBURETER SPECIFICATIONS

For Willys 4 Cylinder Engine: 3⅛ Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1¼ inch I. D.

Float Setting: See adjustments.

Vents: Outside, none. Inside balance vent to air horn, above choke valve.

Gasoline Intake: Square vertical (spring loaded) needle. Size No. 48 (.076 inch) drill, in needle seat.

Low Speed Jet Tube: Jet size, No. 70 (.028 inch) drill. By-pass in air horn, size No. 56 (.0465 inch) drill. Idle bleed size, No. 56 (.0465 inch) drill. Economizer, size No. 54 (.055 inch) drill. Bleed, idle well to bowl (late production), size No. 73 (.024 inch) drill.

Idle Port: Upper port, slot type; length .183-.185 inch. Width, .030 inch.

Idle Port Opening: Top of port: .168 to .172 inch, above top edge of valve with valve tight closed.

Lower Port (For Idle Adjustment Screw): Size, .0615 to .0655 diameter.

Set Idle Adjustment Screw: ¾ to 1¾ turns open. For richer mixture, turn screw out. Do not idle engine below 600 r.p.m.

Main Nozzle: In primary venturi, angle 40° off vertical. Nozzle is installed permanently. Do not remove. Anti-percolator well vent (plug). Size: No. 74 (.0225 inch) drill.

Metering Rod (Diaphragm Type): Economy step, .070 inch diameter; middle step tapers to .068 inch diameter; power step, .056 inch diameter. Length 2-13/16 inches.

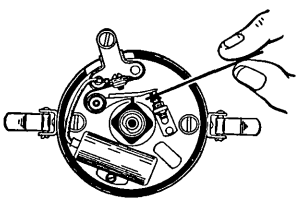
Metering Rod Jet: .096 inch diameter.

Metering Rod Setting: See Adjustments.

Accelerating Pump: Diaphragm type, vacuum and mechanically operated. (Non-adjustable.) Discharge (pump) jet size No. 72 (.025 inch) drill. Intake passage (in diaphragm housing) size No. 72 (.025 inch) drill. Vacuum restriction (in flange) size No. 55 (.052 inch) drill. Vacuum passage (diaphragm bleed) size No. 65 (.035 inch) drill.

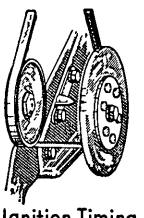
Pump Adjustment: See adjustments.

Choke: Manual, interconnected with throttle. Valve offset butterfly type.



Vacuum Spark Port: .054-.056 inch diameter. Top of port .035 to .045 inch above top edge of valve in closed position.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

diaphragm shaft until diaphragm bottoms in vacuum chamber. (Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod.) Metering rod should contact bottom of metering rod well, and metering rod arm should contact lifter link between springs and at supporting lug. Adjust by bending lip of metering rod arm to which metering rod is attached, up or down.

ACCELERATING PUMP: If acceleration is not satisfactory remove ball check weight and aluminum pump discharge check ball. Then remove pump diaphragm assembly. Check diaphragm for wear or damage. Be sure inlet hole in diaphragm housing is not clogged with lint or foreign matter. If the discharge ball or seat appear damaged, form a new seat by tapping on a 1/8" stainless steel ball (116-11) with 5/32" brass drift and light hammer. Remove stainless steel ball and install new 116-25 aluminum ball. Do not tap on aluminum ball. Then install weight and retainer ring. Inspect and replace all worn or damaged parts and clean and blow out all passages with compressed air. Make sure discharge check seats in casting as a leak at this point will result in poor acceleration.

FAST IDLE ADJUSTMENT: With choke held in wide open postion, lip on fast idle arm should contact boss on body casting. Adjust by bending at offset of fast idle link.

MODEL "DJ-3A"

WILLYS JEEP DISPATCHER 1956-1958

YF DOWN-DRAFT **CARBURETER No. 2392S**

CARBURETER SPECIFICATIONS

For Willys 4 Cylinder Engine: 3 1/8 Inch Bore, 4 3/8 Inch Stroke

Dimensions: Flange size, 1 1/4 inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1 1/4 inch I. D.

Float Setting: Distance from float (at free end) to float chamber cover, with free weight of float on needle and spring to be 9/32 inch.

Vents: Outside, none. Inside balance vent to air horn above choke valve.

Gasoline Intake: Square vertical, spring loaded needle. Size No. 48 drill, in needle seat.

Low Speed Jet Tube: Jet size, No. 68 (.031 inch) drill. By-pass in air horn, size No. 56 drill. Bleed in body, size No. 56 drill. Economizer in body, size No. 54 (.055 inch) drill.

Idle Ports: Upper port, slot type; length .170 inch. Width, .030 inch.

Idle Port Opening: Top of port: .168 to .172 inch, above top edge of valve with valve tight closed. Lower port size: .053 to .057 inch diameter. (For idle adjusting screw.)

Set Idle Adjustment Screw: 1/2 to 2 turns open. For richer mixture, turn screw out. Do not idle engine below 600 r.p.m

Main Nozzle: Nozzle is installed permanently. **DO NOT REMOVE.** Anti-percolator air bleed .0276 inch diameter in plug

Metering Rod (Diaphragm Type): Economy step, .0735 inch diameter; middle step tapers to .062 inch diameter; power step, .044 inch diameter.

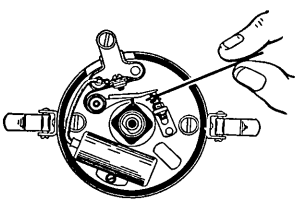
Metering Rod Jet: .096 inch diameter.

Metering Rod Setting: See Adjustments.

Accelerating Pump: Diaphragm type, vacuum operated.
Discharge (pump) jet size, No. 72 drill, relief to bowl .093".
Intake passage (in diaphragm housing) size No. 72 drill.
Vacuum restriction (in flange) size No. 55 drill.
Vacuum passage (diaphragm bleed) size No. 65 drill.

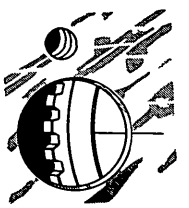
Pump Adjustment: None.

Choke: Manual, interconnected with throttle. Valve, offset butterfly type.

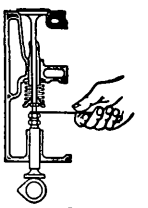


Vacuum Spark Port: 054 to .056 inch diameter. Top of port .035 to .045 inch above top edge of valve in closed position.

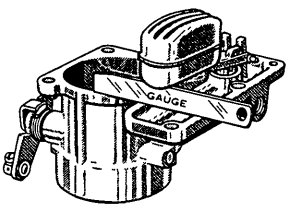
Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .020"

Ignition Timing Breaker Points to Open: 5° B. T. D. C. At Vibration Damper

Valve Setting (Hot or Cold) Intake .016" Exhaust .016"

Float Setting 9/32 (Use Gauge T109-126)

Idle Adjustment Screw Setting 1/2 to 2 Turns Open Idle Engine at 600 R.P.M.

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT: With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed, the distance from the bowl cover to the top of float should be 9/32 inch (gauge T109-126). Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight. Adjust by bending lip of float, not float arm. Float setting must be checked with the bowl cover held at eye height in a level position.

METERING ROD ADJUSTMENT: This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed. With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber. (Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod.) Metering rod should contact bottom of metering rod well and metering rod arm

CARBURETER
TRADE MARK REG. U. S. PAT. FF.
MARCA REGISTRADA

PRINTED IN U.S.A.

should contact lifter link at the outer end nearest the spring and at supporting lug Adjust by bending lip of metering rod arm to which metering rod is attached, up or down

ACCELERATING PUMP If acceleration is not satisfactory remove pump discharge ball check retainer ring and aluminum pump discharge check ball Then remove pump diaphragm assembly Check diaphragm for wear or damage Be sure inlet hole in diaphragm housing is not clogged with lint or foreign matter If the discharge ball or seat appear damaged form a new seat by tapping on a ⅛ inch stainless steel ball with 5/32 inch brass drift and light hammer Remove stainless steel ball and install new 116 25 aluminum ball DO NOT TAP ON ALUMINUM BALL Then install retainer ring Inspect and replace all worn or damaged parts and clean and blow out all passages with compressed air Make sure discharge ball check seats in casting as a leak at this point will result in poor acceleration

FAST IDLE ADJUSTMENT With choke held in wide open position, lip on fast idle arm should contact boss on body casting Adjust by bending at offset portion of choke connector rod

Willys—1956-1958—Carbureter No. 2392S

CARBURETER ADJUSTMENTS

FLOAT ADJUSTMENT Two separate float adjustments must be made—lateral and vertical **LATERAL ADJUSTMENT** With bowl cover assembly inverted bowl cover gasket removed and float lip resting on seated needle place float gauge directly under float with notched portions of gauge fitted over edges of casting Sides of floats should barely touch the vertical uprights of float gauge Adjustment should be made by bending arms of floats

VERTICAL ADJUSTMENT With float gauge in same position floats should just clear the horizontal portion of gauge Vertical distance between top of float and machined surface of casting must be 3/16 inch (gauge T109-28 may be used) Adjust by bending float arms Remove float, install bowl cover gasket and then reinstall float

PUMP ADJUSTMENT Install pump connector link in outer hole (long stroke) of pump arm with ends extending away

CARBURETER
TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

from countershaft arm Back out throttle lever set screw until throttle valves seat in bores of carbureter Be sure fast idle adjusting screw does not hold throttle open Place universal pump travel gauge T109 117S, inverted on edge of dust cover boss of bowl cover Turn knurled nut of gauge until finger just touches upper end of plunger shaft Number indicated on gauge should be '33 Hold the gauge vertical to insure correct reading Adjust by bending the throttle connector rod at upper angle, use tool T109-213 Optional Adjustment With throttle valves seated in bores of carbureter, the distance from the top of the plunger shaft to the top of the dust cover boss should be 22/64 inch Adjust as mentioned above

METERING ROD ADJUSTMENT The metering rods must be adjusted after the pump adjustment No metering rod gauges are necessary Procedure is as follows With the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link until metering rods bottom With rods held in this position, revolve metering rod arm until lip contacts vacumeter link Hold in place and carefully tighten metering rod arm set screw

FAST IDLE ADJUSTMENT. (A) Loosen choke lever clamp screw on choke shaft Insert 040 inch feeler gauge (T109-193) between lip of fast idle cam and boss of flange casting Hold choke valve tightly closed and take slack out of linkage by pressing choke lever towards closed position Hold in place and tighten clamp screw (B) With choke valve tightly closed tighten fast idle adjusting screw until there is 016 inch opening (gauge T109-29 may be used) between throttle valve and bore of carbureter (side opposite idle port) Be sure fast idle adjusting screw is on high step of cam while making this adjustment

UNLOADER ADJUSTMENT With throttle wide open there should be ⅛ inch (gauge T109-36) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending unloader lip on throttle shaft lever (use bending tool T109-41)

WILLYS
6-226 ENGINE
1954-1955

WDG Dual Down-Draft Climatic® Control Carbureters—**Nos. 2052S-2052SA**

CARBURETER SPECIFICATIONS

For Willys 6 Cylinder Engine: 3-5/16 Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size, 1¼ inch dual, 4 bolt type.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 21/32 inch I. D
Main venturi, 1-1/16 inch I. D

Float Level: See Adjustments

Vents: Outside: .156 inch diameter. Inside: No. 32 (.116 inch) drill.

Gasoline Intake: Size No. 42 (.0935 inch) drill in needle seat.

Low Speed Jet Tube: Jet, size No. 70 (.028 inch) drill. By-pass, in air horn, size No. 56 (.0465 inch) drill. Economizer, in air horn, size No. 55 (.052 inch) drill. Idle bleed, in air horn, size No. 54 (.055 inch) drill. Idle restriction, in body, size No. 52 (.0635 inch) drill.

Idle Port: Upper port, slot type, length .160 inch; width, .030 inch.

Idle Port Opening: .117 to .123 inch above upper edge of valve with valve tightly closed.

Lower Port (For Idle Adjustment Screw): .068 to .072 inch diameter.

Set Idle Adjustment Screw: ½ to 1½ turns open. For richer mixture turn screw out. Idle engine at 450 R.P.M. on Hydra matic transmission and 500 on Standard and Overdrive transmissions.

Main Nozzle: Nozzle is installed permanently DO NOT REMOVE.

Metering Rod (Vacumeter Type): Economy step .065 inch diameter. Middle step tapers to .0485 inch diameter. Power step .041 inch diameter. (These rods designed with stabilizing flats on economy step.)

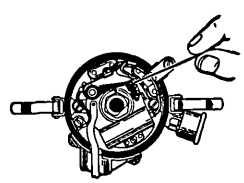
Metering Rod Jet: No. 44 (.086 inch) drill.

Metering Rod Setting: See Adjustments.

Accelerating Pump: Discharge jet (twin) size, No. 74 (.0225 inch) drill. Intake ball check seat size No. 40 (.098 inch) drill. Discharge needle seat size No. 50 (.070 inch) drill.

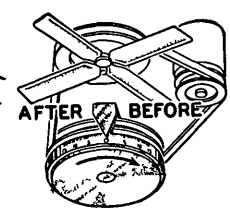
Pump Adjustment: See Adjustments.

Choke: Carter Climatic® Control set (2052S) 2 points rich; (2052SA) Index. Offset butterfly type. Choke heat suction hole in piston housing, size No. 42 (.0935 inch) drill.



Vacuum Spark Port: Horizontal slot (round end) size 045 by .110 inch. Top of port .020 inch above top edge of valve with valve tightly closed.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter

CARBURETER
TRADE MARK REG. U. S. PAT OFF.
MARCA REGISTRADA

finger on gauge just touches top of plunger shaft The distance from the dust cover boss to the top of the plunger shaft should be ½ inch (distance from base to tip of finger on gauge) Adjust by bending throttle connector rod at upper angle

METERING ROD ADJUSTMENT. The metering rods must be adjusted after the pump adjustment or when leaner than standard rods are installed No metering rod gauges are necessary Procedure is as follows With the throttle lever set screw backed out and throttle valves seated in bores of carbureter, press down on vacumeter link until metering rods bottom With rods held in this position revolve metering rod arm until lip contacts vacumeter link Hold in place and carefully tighten metering rod arm set screw

FAST IDLE ADJUSTMENT. With the thermostatic coil housing, gasket and baffle plate removed, crack throttle valve and hold choke valve closed Then close throttle There should now be .018"-.023" clearance (gauge T109-29) between throttle valve and bore of carbureter (side opposite idle port) Adjust by bending the choke connector rod at lower angle

UNLOADER ADJUSTMENT. Must be made after fast idle adjustment Hold throttle valve wide open and close choke valve as far as possible without forcing, there should now be 9/64 inch (gauge T109-34) clearance between upper edge of choke valve and inner wall of air horn Adjust by bending arm on choke trip lever

YF Down-Draft Carbureters—**Nos. 924S-2071S**

CARBURETER SPECIFICATIONS

For Willys 6 Cylinder Engine: 3⅛ Inch Bore, 3½ Inch Stroke

Dimensions: Flange size, 1¼ inch S A E
Primary venturi, 11/32 inch I D
Secondary venturi, 11/16 inch I D
Main venturi 1-5/16 inch I. D

Float Setting: See adjustments

Vents: Outside none. Inside balance vent to air horn above choke valve

Gasoline Intake: Spring loaded needle Size No 48 (076 inch) drill in needle seat

Low Speed Jet Tube Jet size No 70 (028 inch) drill By pass in air horn, size No 57 (043 inch) drill. Economizer, size No 55 (052 inch) drill Idle bleed, size No 53 (0595 inch) drill

Idle Port: Upper port slot type length 159 to 161 inch, width 030 inch

Idle Port Opening: Top of port 148 to 152 inch above top edge of valve with valve tightly closed

Lower Port (For Idle Adjustment Screw): Size 0615 to 0655 inch diameter

Set Idle Adjustment Screw 1 to 2 turns open For richer mixture turn screw out Do not idle engine below 600 r p m

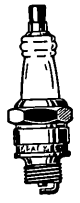
Main Nozzle. Nozzle is installed permanently DO NOT REMOVE Anti percolator well vent (plug) size No 75 (021 inch) drill

Metering Rod (Diaphragm Type). Economy step 076 inch diameter middle step tapers to 064 inch diameter power step, 047 inch diameter

Metering Rod Jet: Size No 40 (098 inch) drill

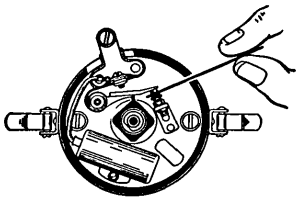
Metering Rod Setting: See adjustments

Accelerating Pump: Diaphragm type, vacuum and mechanically operated Pump jet, size No 72 (025 inch) drill Intake passage (in diaphragm housing), size No 75 (021 inch) drill Discharge ball check seat (in body), size No 42 (0935 inch) drill Vacuum restriction (in flange), size No 55 (052 inch) drill Vacuum passage diaphragm bleed, size No 65 (035 inch) drill



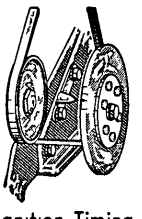
Pump Adjustment· None

Choke: Manual, interconnected with throttle Valve offset butterfly type

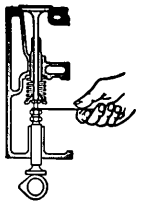


Vacuum Spark Port: 054 to 056 inch diameter Top of port 035 to 045 inch above top edge of valve with valve tightly closed

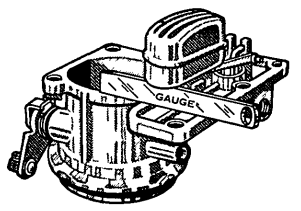
Motor Tune-Up—Be Accurate!



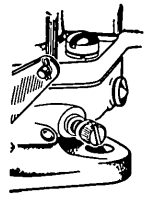
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: 5° B.T.D.C. (or road-set for light detonation)

Valve Setting (Hot or Cold) Intake .018" Exhaust .016"

Float Setting See Adjustments

Idle Adjustment Screw Setting 1 to 2 Turns Open

CARBURETER ADJUSTMENTS

Float Adjustment. With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed, the distance from the bowl cover to the top of float should be 9/32 inch (gauge T109-126) Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight Adjust by bending lip of float, not float arm Float setting must be checked with the bowl cover held at eye height in a level position

Metering Rod Adjustment: This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed. With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber (Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod) Metering rod should contact bottom of metering rod well and metering rod arm

TRADE MARK REG U S PAT OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.

should contact lifter link at the outer end nearest the springs and at supporting lug Adjust by bending lip of metering rod arm, to which metering rod is attached up or down

Accelerating Pump If acceleration is not satisfactory remove pump discharge ball check retainer ring and aluminum pump discharge check ball Then remove pump diaphragm assembly Check diaphragm for wear or damage Be sure inlet hole in diaphragm housing is not clogged with lint or foreign matter Inspect and replace all worn or damaged parts and clean and blow out all passages with compressed air Make sure discharge ball check seats in casting as a leak at this point will result in poor acceleration

Fast Idle Adjustment With choke held in wide open position lip on fast idle arm should contact boss on body casting Adjust by bending at offset portion of choke connector rod

Willys—1952-55—Carbureters Nos. 924S-2071S

4-73 ENGINE

WILLYS STATION WAGON JEEPSTER, PANEL DELIVERY 4WD TR.–2WD TR. 1950-51

Casting No. 630 on face of flange

YF Down-Draft Carbureters—**Nos. 832S-832SA-832SB**

CARBURETER SPECIFICATIONS

For Willys 4 Cylinder Engine: 3⅛ Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size 1¼ inch S A E
Primary venturi, 11/32 inch I D
Secondary venturi, 11/16 inch I D
Main venturi 1¼ inch I D

Float Setting. Distance from top of float (at free end) to float chamber cover when needle is seated 5/16 inch (Use gauge No T109-107)

Vents: Outside none Inside balance vent to air horn above choke valve

Gasoline Intake: Square vertical (spring loaded) needle Size No 48 drill in needle seat

Low Speed Jet Tube: Jet size No 70 (.028 inch) drill By-pass in air horn, size No 56 (.0465 inch) drill Idle bleed size, No 56 (.0465 inch) drill Economizer size No 54 (.055 inch) drill Bleed idle well to bowl (late production), size No 73 (.024 inch) drill

Idle Ports: Upper port slot type length 183-185 inch Width, .030 inch

Idle Port Opening: Top of port 168 to 172 inch, above top edge of valve with valve tightly closed Lower port size 0615 to 0655 inch diameter (for idle adjusting screw)

Set Idle Adjustment Screw: ¾ to 1¾ turns open For richer mixture turn screw out Do not idle engine below 600 r p m

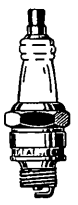
Main Nozzle: In primary venturi, angle 40° off vertical Nozzle is installed permanently **Do not remove.** Anti percolator well vent (plug) Size No 74 (.0225 inch) drill

Metering Rod (Diaphragm Type): Economy step .070 inch diameter middle step tapers to .068 inch diameter, power step, .056 inch diameter Length 2-13/16 inches

Metering Rod Jet: .096 inch diameter

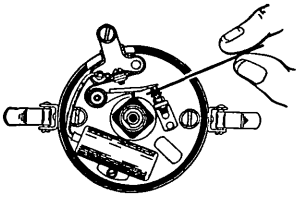
Metering Rod Setting: See Adjustments

Accelerating Pump: Diaphragm type vacuum operated (Non-adjustable) Discharge (pump) jet size No 72 drill Intake passage (in diaphragm housing) size No 72 drill Vacuum restriction (in flange) size No 55 drill Vacuum passage (diaphragm bleed) size No 65 drill



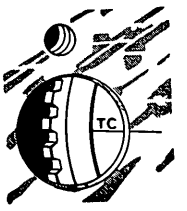
Pump Adjustment: See Adjustments

Choke: Manual interconnected with throttle Valve offset butterfly type

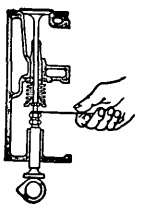


Vacuum Spark Port: .054-.056 inch diameter Top of port .035 to .045 inch above top edge of valve in closed position

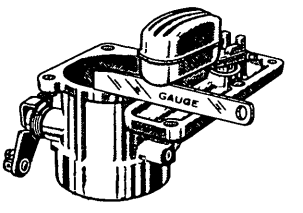
Motor Tune-Up—Be Accurate!



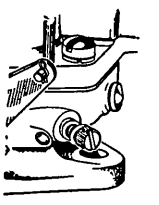
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap .030"



Breaker Point Setting .020"



Ignition Timing Breaker Points to Open: T. D. C. (Road set for light detonation)

Valve Setting (Cold) Intake .018" Exhaust .016"

Float Setting 5/16 Inch (Use Gauge T109-107)

Idle Adjustment Screw Setting ¾ to 1¾ Turns Open

CARBURETER ADJUSTMENTS

Float Adjustment: With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed, the distance from the bowl cover to the top of float should be 5/16" (Use gauge No T109-107) Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight Adjust by bending lip of float, not float arm Float setting must be checked with the bowl cover held at eye height in a level position

Metering Rod Adjustment: This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed With throttle valve seated in bore of carbureter, press down on upper end of diaphragm shaft until diaphragm bottoms in vacuum chamber (Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod)
Metering rod should contact bottom of metering rod well and metering rod arm should contact lifter link between

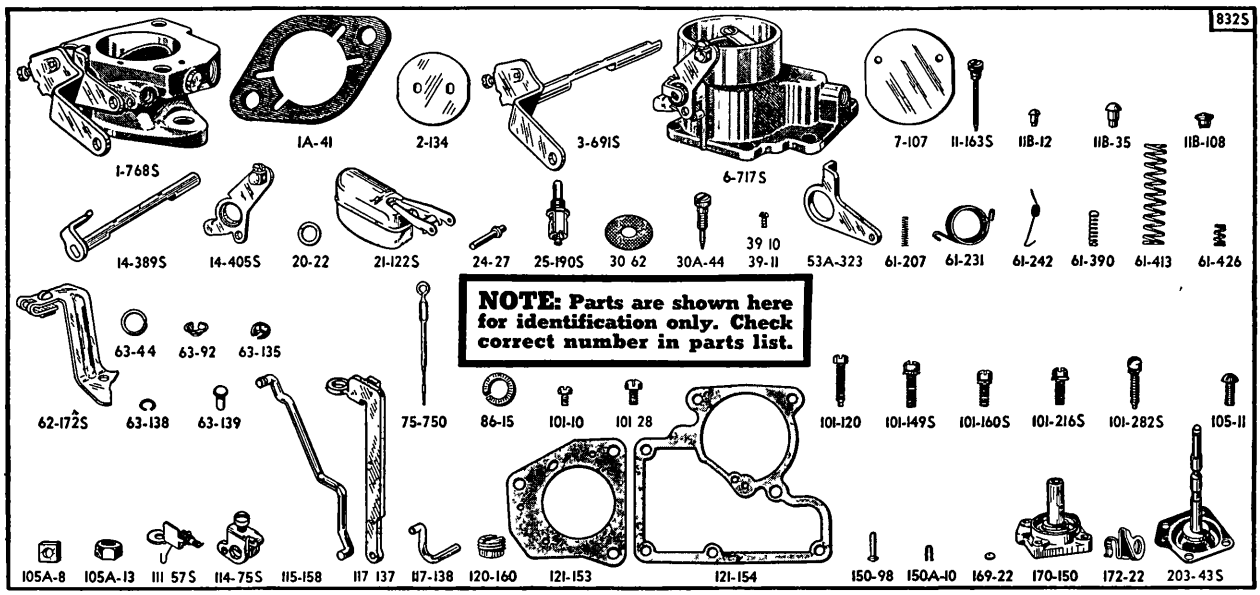
CARBURETER
TRADE MARK REG U S PAT. OFF
MARCA REGISTRADA

PRINTED IN U.S.A.

springs and at supporting lug Adjust by bending lip of metering rod arm, to which metering rod is attached, up or down



Accelerating Pump: If acceleration is not satisfactory remove pump check retainer and pump discharge check disk (832S), or ball check weight and aluminum pump discharge check ball (832SA) Then remove pump diaphragm assembly. Check diaphragm for wear or damage Be sure inlet hole in diaphragm housing is not clogged with lint or foreign matter. Intake screen (if so equipped) should be removed in service

If carbureter is equipped with disk type pump discharge check, replace with aluminum ball check and weight Unitized package (Part No 116-27U), consisting of (1) ⅛" steel ball, (1) ⅛" aluminum ball, (1) 63-152 retainer and (1) 221-13 ball check weight should be used Complete instructions for this conversion are contained in the package

If the discharge ball or seat, in carbureters equipped with aluminum ball check and weight, appear damaged, form a new seat by tapping on a ⅛" stainless steel ball (116-11) with 5/32" brass drift and light hammer Remove stainless steel ball and install new 116-25 aluminum ball **Do not tap on aluminum ball.** Then install weight and retainer ring

Inspect and replace all worn or damaged parts and clean and blow out all passages with compressed air Make sure discharge check seats in casting as a leak at this point will result in poor acceleration

Fast Idle Adjustment With choke held in wide open position, lip on fast idle arm should contact boss on body casting Adjust by bending at offset of fast idle link

WILLYS STATION WAGON, JEEPSTER, PANEL DELIVERY, 4WD TR.–2WD TR. 1950

(832SB can also be used)

YF Down-Draft Carbs.—**Nos. YF-768S, YF-768SA, YF-768SB**

CARBURETER SPECIFICATIONS

For Willys 4 Cylinder Engine: 3⅛ Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1¼ inch I. D.

Float Setting: Distance from float (at free end) to float chamber cover, with free weight of float on needle and spring to be 5/16 inch.

Vents: Outside, none. Inside balance vent to air horn above choke valve.

Gasoline Intake: Square vertical, spring loaded needle. Size No. 48 drill, in needle seat.

Low Speed Jet Tube: Jet size, No. 70 (.028 inch) drill. By-pass in air horn, size No. 56 drill. Bleed in body, size No. 56 drill. Economizer in body, size No. 54 (.055 inch) drill.

Idle Ports: Upper port, slot type; length .184 inch. Width, .030 inch.

Idle Port Opening: Top of port: .168 to .172 inch, above top edge of valve with valve tightly closed. Lower port size: .053 to .057 inch diameter. (For idle adjusting screw.)

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture, turn screw out. Do not idle engine below 600 r.p.m

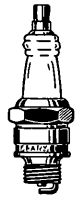
Main Nozzle: In primary venturi, angle 40° off vertical. Nozzle is installed permanently. DO NOT REMOVE. Anti-Percolator air bleed .0223 inch diameter in plug.

Metering Rod (Diaphragm Type): Economy step, .070 inch diameter; middle step tapers to .068 inch diameter; power step, .056 inch diameter.

Metering Rod Jet: .096 inch diameter.

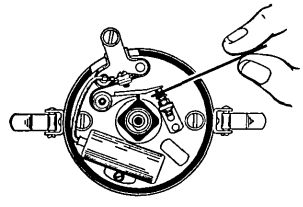
Metering Rod Setting: See Adjustments.

Accelerating Pump: Diaphragm type, vacuum operated. Discharge (pump) jet size, No. 72 drill, relief to bowl .093 inch. Intake (disk check) size, No. 40 (.098 inch) drill. Vacuum restriction (in flange) size No. 55 drill. Vacuum passage (diaphragm bleed) size No. 65 drill.



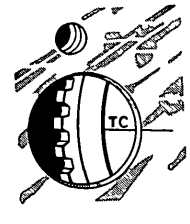
Pump Adjustment: None.

Choke: Manual, interconnected with throttle. Valve, offset butterfly type.



Vacuum Spark Port: .054 to .056 inch diameter. Top of port .035 to .045 inch above top edge of valve in closed position.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

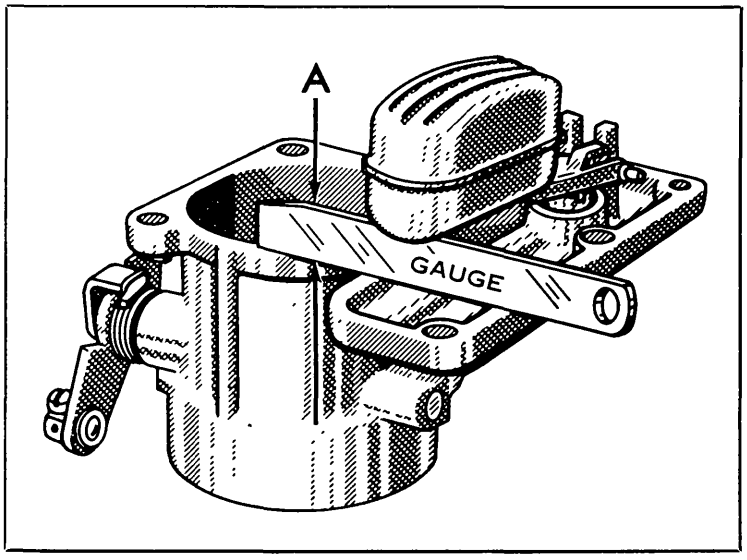

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed, the distance (A) from the bowl cover to the top of float should be 5/16" (gauge T109-107). Do not depress float lip against spring loaded pin in needle, but let float rest of its own weight. Adjust by bending lip of float, not float arm.

Float setting must be checked with the bowl cover held at eye height in a level position.

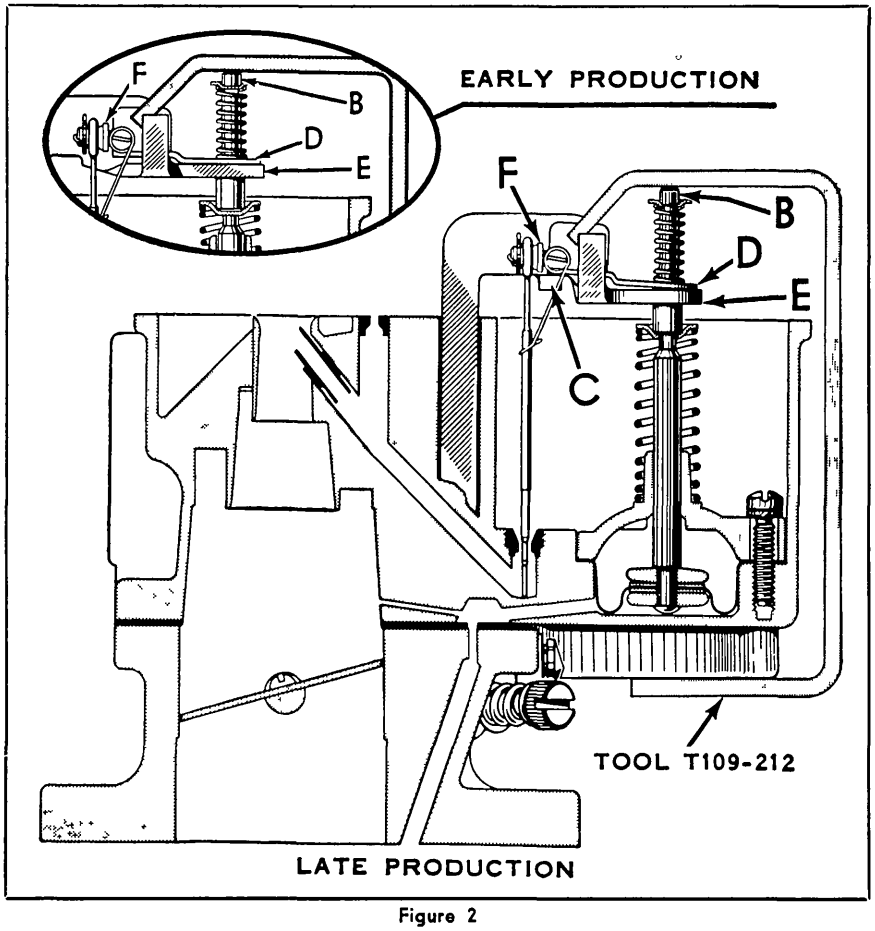

Figure 2
Metering R d Adjustment

METERING ROD ADJUSTMENT (Fig 2):

This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed. With throttle valve seated in bore of carbureter press down on upper end of diaphragm shaft (B) until diaphragm bottoms in vacuum chamber. (Tool T109-212 may be used to hold diaphragm shaft down while adjusting metering rod.)

On late production carbureters which have projection (C) on pump lifter link, metering rod should contact bottom of metering rod well, and metering rod arm (D) should contact lifter link (E) between springs and at supporting lug (C). Adjust by bending lip (F) up or down.

On early production carbureters which do not have projection (C) on pump lifter link, metering rod should bottom in metering rod well and flat of metering rod arm (D) should make parallel contact with flat of pump lifter link (E). Adjust by bending lip (F) up or down.

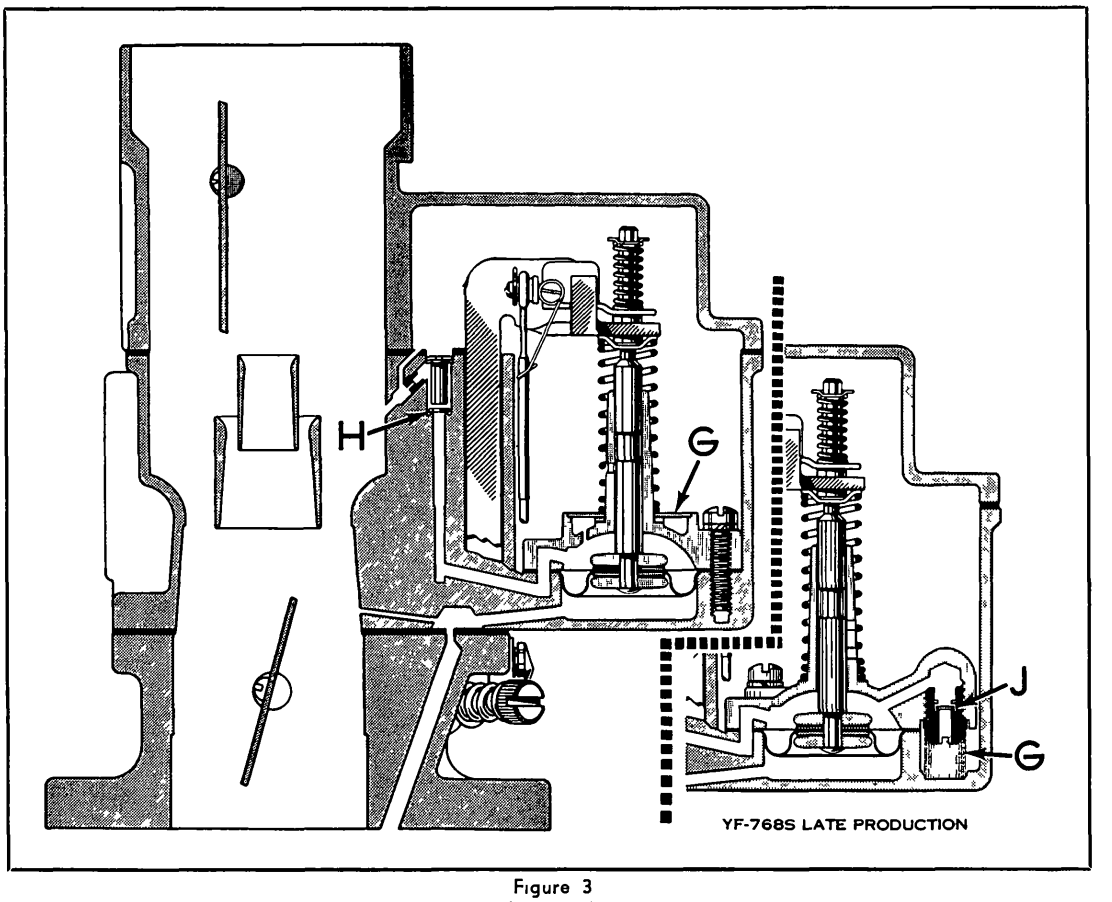

Figure 3
Accelerating Pump

ACCELERATING PUMP.

If acceleration is not satisfactory remove pump check retainer and pump discharge check disk or ball check weight and aluminum pump discharge check ball Then remove pump diaphragm assembly Check diaphragm for wear or damage Be sure inlet hole in diaphragm housing is not clogged with lint or foreign matter Flat intake screen (G) if so equipped should be removed in service on units without intake check valve (J) Tubular intake screen (G) is **not** to be removed on units using intake check valve (J) If carbureter is equipped with disk type pump discharge check (H) replace with aluminum ball check and weight Unitized package (Part No 116 27U), consisting of (1) 1/8" steel ball (1) 1/8" aluminum ball, (1) 63 152 retainer and (1) 221 13 ball check weight should be used Complete instructions for this conversion are contained in the package Inspect and replace all worn or damaged parts and clean and blow out all passages with compressed air Make sure discharge ball check seats in cast ing as leak at this point will result in poor acceleration

NOTE Insert (Fig 3) shows pump diaphragm housing which has an intake check valve (J) This was used only on YF768S late production YF768S early production and YF768SA use pump diaphragm housing shown in main illustration of Fig 3 See unit ized package note at bottom of page 4

FAST IDLE ADJUSTMENT (Fig. 4):

With choke held in wide open position lip (K) on fast idle arm should contact boss on body casting Adjust by bend ing at offset of fast idle link (L)

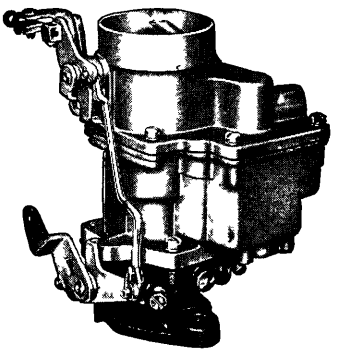
WILLYS CARBURETERS Nos. YF-768S, YF-768SA, YF-768SB

WHEN SERVICING, USE GASKET ASSORTMENT No. 206A; REPAIR PACKAGE No. 1557A

PART NAMES IN CAPITAL LETTERS, LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No.	PART NAME	
1-768S	Body flange assembly	
1A-41	FLANGE GASKET	
2-134	Throttle valve	
3-691S	Throttle shaft and lever assembly	
6-671S	Air horn assembly (Sup. by 6 717S)	
6-717S	Air horn assembly	
7-107	Choke valve	
11-161S	LOW SPEED JET ASSEMBLY	
11-163S	Low speed jet assembly (Sup by 11-161S)	
11B-12	Flange passage plug	
11B-35	Nozzle passage rivet plug	
11B-108	IDLE PORT RIVET PLUG	
14-389S	Choke shaft and lever assembly	
14-405S	Choke lever assembly	
20-22	Needle seat gasket	
21-122S	Float and lever assembly	
24-27	Float lever pin	
25-166S	NEEDLE, SPRING AND SEAT ASSEMBLY	
30-20	Pump intake strainer (768S—late prod.)	
30-62	Pump intake strainer (768S—early prod. and 768SA) (Discontinued)	
30A-44	Idle adjustment screw	
39-10	Choke valve attaching screw	(2)
39-11	THROTTLE VALVE ATTACHING SCREW	(2)
53A-323	Fast idle arm	
61-84	Idle screw spring (Sup. by 61 426)	
61-207	Intake needle spring	
61-231	Choke lever spring	
61-242	Metering rod spring	
61-390	Upper pump spring (Sup. by 61-432)	
61-412	Upper pump spring (Sup. by 61 390)	
61-413	Pump diaphragm spring (Discontinued)	
61-426	Idle screw spring	
61-431	UPPER PUMP SPRING (OUTER)	
61-432	UPPER PUMP SPRING	
62-172S	Choke tube clamp assembly	
63-44	Choke lever retaining ring	
63-92	Diaphragm spring retainer (Discontinued)	
63-134	Pump disk retainer (Sup. by 63 139)	
63-135	UPPER PUMP SPRING RETAINER	
63-138	Pump disk retainer ring (Sup. by 63 152)	
63-139	Pump disk retainer (Sup. by 116 27U)	
63-152	Pump discharge ball check retainer	
75-733	Metering rod, standard (Sup. by 75-750)	
75-735	Metering rod, 1 size lean (Sup. by 75-808)	
75-750	Metering rod standard (Sup. by 75-806)	
75-806	METERING ROD, STANDARD	
75-807U	†Unitized package	
75-808	Metering rod, 1 size lean	
86-15	Flange stud lock washer	(2)
101-10	Wire clamp screw	
101-28	Throttle shaft arm attaching screw	
101-120	Throttle lever adjustment screw	
101-149S	Body flange attaching screw and washer assembly	(3)
101-160S	Air horn attaching screw and washer assembly	(5)
101-216S	Air horn attaching screw and washer assembly	(2)
101-282S	Diaphragm housing attaching screw and washer assembly	(4)
105-11	Tube clamp screw	
105A-8	Tube clamp nut	
105A-13	Flange nut	(2)
111-57S	Metering rod arm assembly	
114-75S	THROTTLE SHAFT ARM ASSEMBLY	
115-158	Fast idle connector rod	
116-25	Pump discharge ball check	
116-27U	UNITIZED PACKAGE (Consists of 1—116-11, 1—116-25 1—63-152 and 1—221 13)	
117-137	PUMP LIFTER LINK	
117-138	PUMP CONNECTOR LINK	
120-160	METERING ROD JET	
121-153	BODY FLANGE GASKET	
121-154	BOWL COVER AND AIR HORN GASKET	
122-95S	Intake disk check assembly	
150-98	Intake needle pin	
150A-10	PIN SPRING	(2)
169-22	Pump check disk (Sup. by 116 27U)	
170-150	†Pump diaphragm housing	
170-160	Pump diaphragm housing (Sup. by 170 150 and 75 807U)	
172-22	Throttle connector rod retainer	
203-43S	PUMP DIAPHRAGM ASSEMBLY	
221-13	Ball check weight	



†To convert 768S to 768SB use 170-150 and 75-807U. To convert 768SA to 768SB use only 75-807U. 75-807U consists of (1) 11-161S (1) 61-431, (1) 61-432, (1) 75-806, (1) 107-38, (1) 107-39 and (1) 121-154

NOTE: Figures in parentheses indicate number of pieces used in one carbureter. Where no figure is shown, only one is used.

WILLYS 738S-738SA
April, 1950
Revised June, 1953

463 Series

WILLYS STATION WAGON, JEEPSTER AND PANEL DELIVERY 1950

YF DOWN-DRAFT **CARBURETERS Nos. YF-738S-738SA**

CARBURETER SPECIFICATIONS

For Willys 4 Cylinder Engine: 3⅛ Inch Bore, 4⅜ Inch Stroke

Dimensions: Flange size, 1¼ inch S. A. E.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1¼ inch I. D.

Float Setting: Distance from float (at free end) to float chamber cover, with free weight of float on needle and spring to be 9/32 inch.

Vents: Outside, none. Inside balance vent to air horn above choke valve.

Gasoline Intake: Square vertical, spring loaded needle. Size No. 48 drill, in needle seat.

Low Speed Jet Tube: Jet size, No. 68 (.031 inch) drill. By-pass in air horn, size No. 56 drill. Bleed in body, size No. 56 drill. Economizer in body, size No. 54 (.055 inch) drill.

Idle Ports: Upper port, slot type; length .170 inch. Width, .030 inch.

Idle Port Opening: Top of port: .168 to .172 inch, above top edge of valve with valve tight closed. Lower port size: .053 to .057 inch diameter. (For idle adjusting screw.)

Set Idle Adjustment Screw: ¾ to 1¾ turns open. For richer mixture, turn screw out. Do not idle engine below 600 r.p.m.

Main Nozzle: Nozzle is installed permanently. **DO NOT REMOVE.** Anti-percolator air bleed .0276 inch diameter in plug.

Metering Rod (Diaphragm Type): Economy step, .0735 inch diameter; middle step tapers to .062 inch diameter; power step, .044 inch diameter.

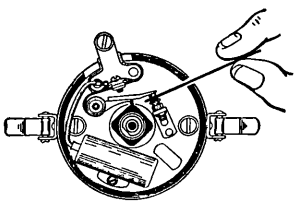
Metering Rod Jet: .096 inch diameter.

Metering Rod Setting: See Adjustments.

Accelerating Pump: Diaphragm type, vacuum operated.
Discharge (pump) jet size, No. 72 drill, relief to bowl .093".
Intake passage (in diaphragm housing) size No. 72 drill.
Vacuum restriction (in flange) size No. 55 drill.
Vacuum passage (diaphragm bleed) size No. 65 drill

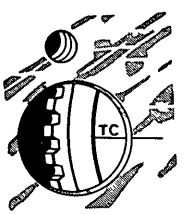
Pump Adjustment: None.

Choke: Manual, interconnected with throttle. Valve, offset butterfly type.



Vacuum Spark Port: .054 to .056 inch diameter. Top of port .035 to .045 inch above top edge of valve in closed position.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

CARBURETER ADJUSTMENTS

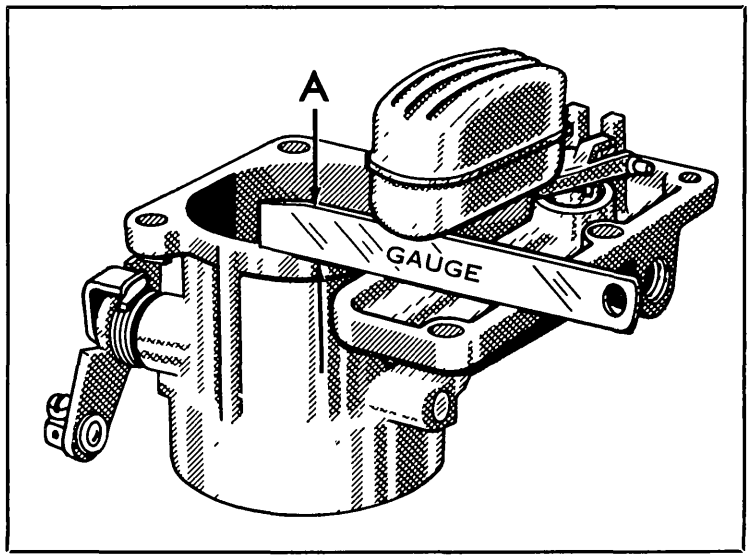

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig 1)

With bowl cover assembly inverted and float resting on pin in seated needle and with gasket removed the distance (A) from the bowl cover to the top of float should be 9/32" (gauge T109 126) Do not depress float lip against spring in needle but let float rest of its own weight Adjust by bending lip of float not float arm

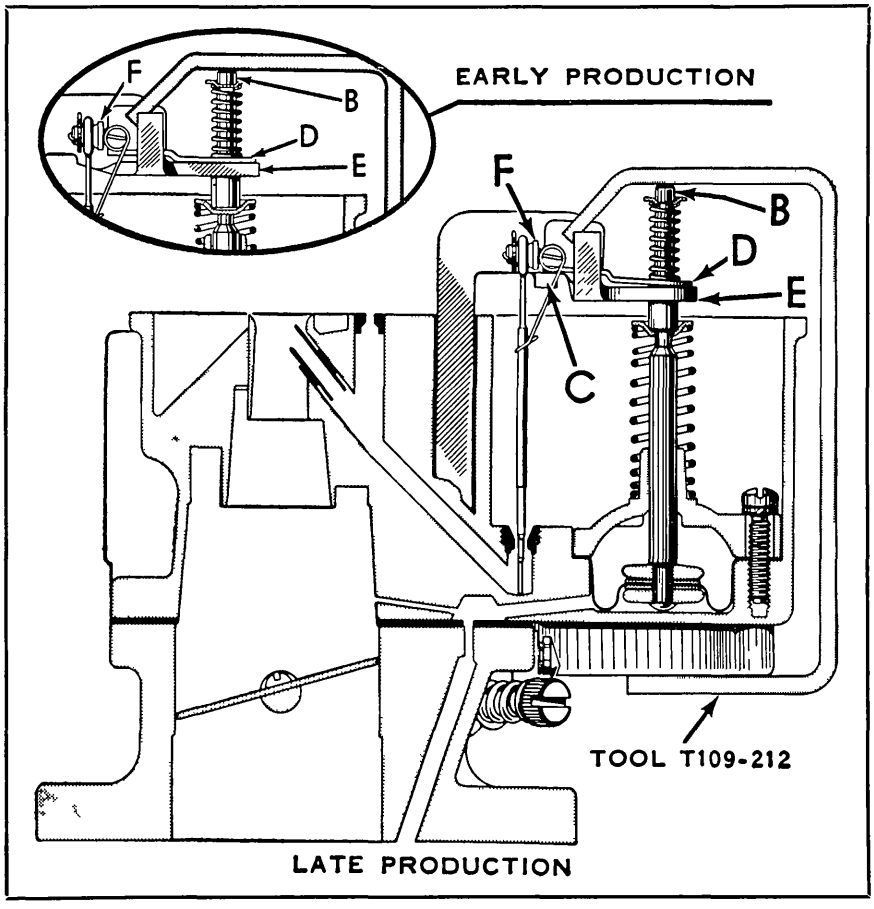

Figure 2
Metering Rod Adjustment

METERING ROD ADJUSTMENT
(Fig 2)

This adjustment is important and should be checked each time the carbureter is reassembled or lean rods are installed With throttle valve seated in bore of carbureter press down on upper end of diaphragm shaft (B) until diaphragm bottoms in vacuum chamber (Tool T109 212 may be used to hold diaphragm shaft down while adjusting metering rod)

On late production carbureters which have projection (C) on pump lifter link metering rod should contact bottom of metering rod well and metering rod arm (D) should contact lifter link (E) between spring and at supporting lug (C) Adjust by bending lip (F) up or down

On early production carbureters which do not have projection (C) on pump lifter link metering rod should bottom in metering rod well and flat of metering rod arm (D) should make parallel contact with flat of pump lifter link (E) Adjust by bending lip (F) up or down

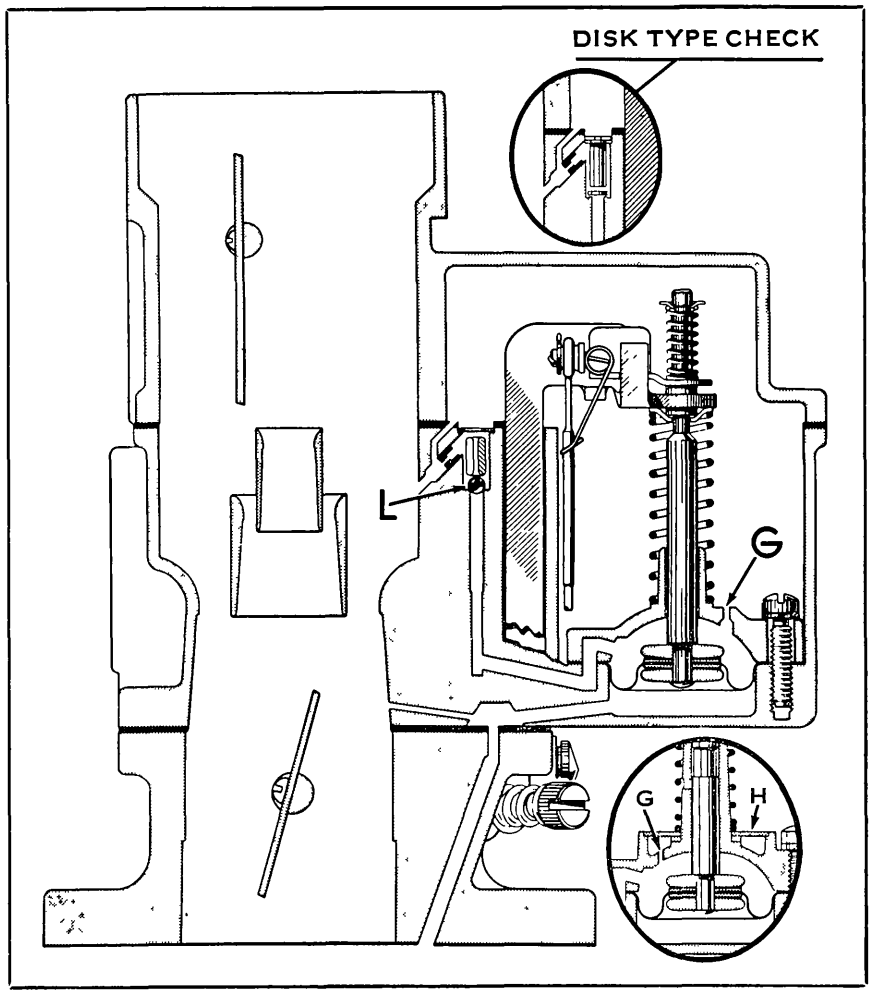

Figure 3
Accelerating Pump

ACCELERATING PUMP (Fig. 3):

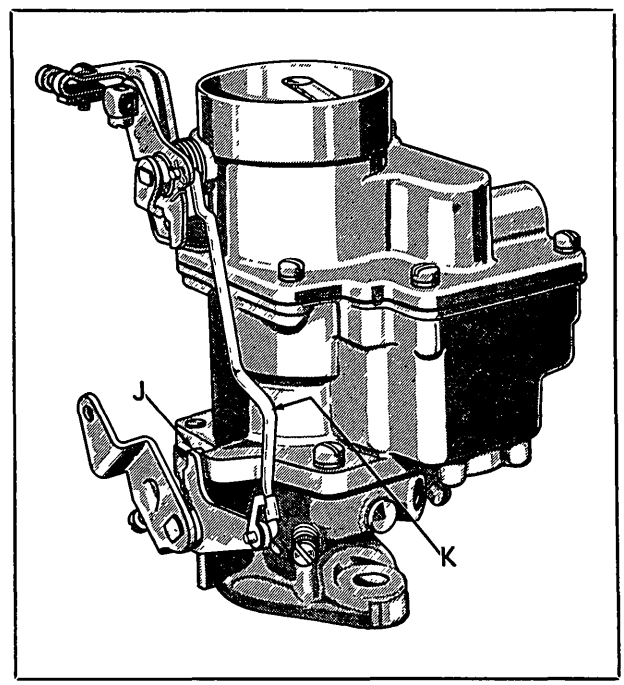
If acceleration is not satisfactory, remove pump check retainer and pump discharge check disk (738S), or ball check weight and aluminum pump discharge check ball (738SA). Then remove pump diaphragm assembly Check diaphragm for wear or damage. Be sure inlet hole in diaphragm housing is not clogged with lint or foreign matter. Intake screen (if so equipped) should be removed in service. If carbureter is equipped with disk type pump discharge check, replace with aluminum ball check and weight. Unitized package (Part No. 116-27U), consisting of (1) 1/8" steel ball, (1) 1/8" aluminum ball, (1) 63-152 retainer and (1) 221-13 ball check weight should be used. Complete instructions for this conversion are contained in the package.

If the discharge ball or seat, in carbureters equipped with aluminum ball check and weight, appear damaged, form a new seat by tapping on a 1/8" stainless steel ball (116-11) with 5/32" brass drift and light hammer. Remove stainless steel ball and install new 116-25 aluminum ball. **Do not tap on aluminum ball.** Then install weight and retainer ring.

Inspect and replace all worn or damaged parts and clean and blow out all passages with compressed air. Make sure discharge check seats in casting, as a leak at this point will result in poor acceleration.

FAST IDLE ADJUSTMENT (Fig. 4):

With choke held in wide open position, lip (J) on fast idle arm should contact boss on body casting Adjust by bending at offset of fast idle link (K).



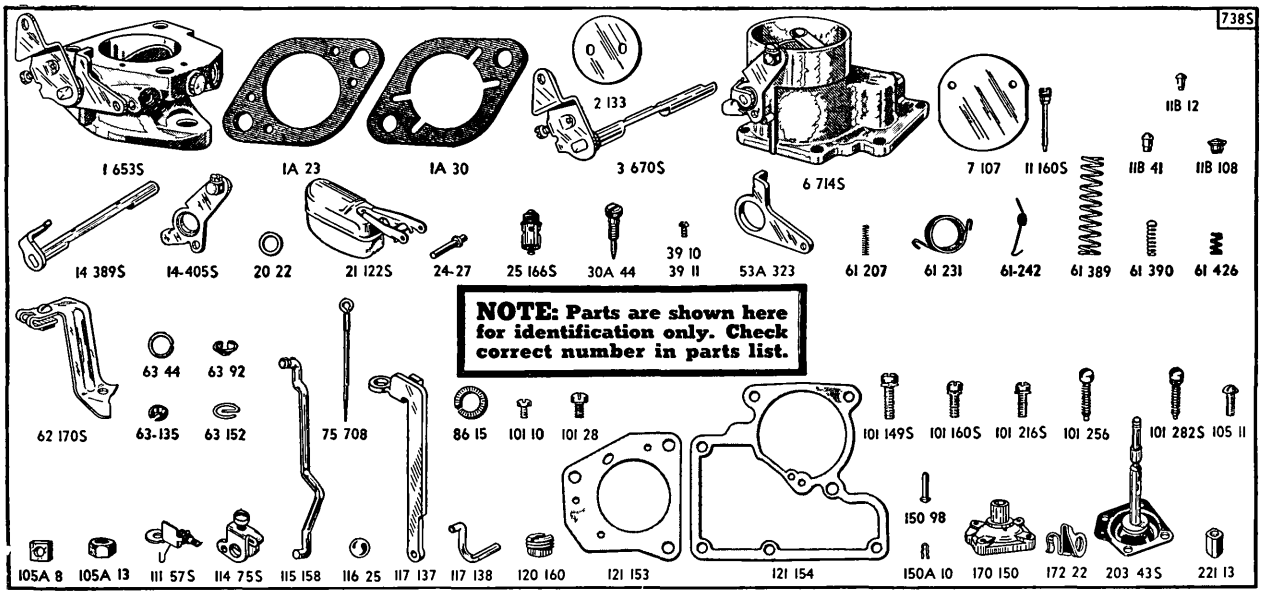


Figure 4
Fast Idle Adjustment

Willys Carbureters Nos. YF-738S-738SA

WHEN SERVICING, USE GASKET ASSORTMENT No 200; REPAIR PACKAGE No 1546B

PART NAMES IN CAPITAL LETTERS LISTED BELOW, INDICATE CONTENTS OF REPAIR PACKAGE

Part No.	PART NAME	
1-653S	Body flange assembly	
1A 23	Flange gasket (for use with governor)	
1A-30	FLANGE GASKET (FOR USE WITHOUT GOVERNOR)	
2-133	Throttle valve	
3-670S	Throttle shaft and lever assembly	
6-653S	Air horn assembly (Sup by 6 714S)	
6-714S	Air horn assembly

W-O DOWN-DRAFT **CARBURETERS 596S-636S-636SA**

CARBURETER SPECIFICATIONS

For Willys 4 Cylinder Engine: 3⅛ Inch Bore; 4⅜ Inch Stroke

Dimensions: Flange size, 1 inch S. A. E.
Primary venturi 11/32 inch I. D.
Main venturi, 1.0 inch I. D.

Float Setting: Distance from float (at free end) to float chamber cover to be ⅜ inch with free weight of float on needle and spring.

Vents: Outside, No. 10 drill size.

Gasoline Intake: Square vertical needle. No. 53 drill size in needle seat.

Low Speed Jet Tube: Jet size, .026 inch diameter (early production), .029 inch diameter (later production). Idle well jet, No. 61 drill.
By-pass in body, .059 to .060 inch diameter.
Economizer in body, .0425-.0435 inch diameter.
Idle bleed, size No. 52 drill.

Idle Port: Length, .140 inch. Width .030 inch.

Idle Port Opening: .086 to .090 inch above upper edge of valve with valve closed tight.

Idle Screw Seat: No. 46 drill.

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture, turn screw out. Do not attempt to idle engine below 8 miles per hour.

Main Nozzle: (Flush type) in primary venturi, angle 30°. Discharge jet size, .096 inch diameter.

Metering Rod: Economy step, .060 inch, tapers to .048 inch diameter. Power step .047 inch diameter. Length 3-23/64 inches.

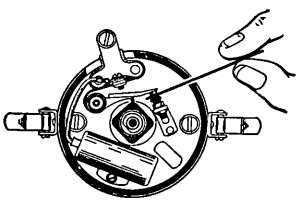
Metering Rod Jet: Size, .070 inch diameter.

Metering Rod Setting: Use gauge, part No. T109-26 (2.718 inches).

Accelerating Pump: High pressure type, spring operated.
Discharge jet size, No. 73 drill.
Relief passage to outside, size No. 42 drill.
Intake ball check size, No. 40 drill.
Discharge disk check size, No. 40 drill.

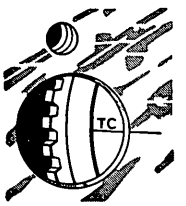
Pump Adjustment: 17/64 inch plunger travel at full throttle position. Use gauge T109-117S.

Choke: Manual—Offset, butterfly type with pressure relief poppet valve. Inter-connected to open throttle valve to fast idle position when choke is used.



Vacuum Spark Port: (636S) Size, .062 to .064 inch diameter. Top of port .056 to .062 inch above top edge of valve.

Motor Tune-Up—Be Accurate!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

SERVICE INSTRUCTIONS

TO DISASSEMBLE

Remove carbureter from motor. Use Carter Tool Kit.

1. Remove choke link pin spring, choke connector link and spring.
2. Remove air horn assembly with all parts attached.
3. Remove low speed jet plug assembly.
4. Remove low speed jet.
5. Remove throttle shaft arm and screw assembly and throttle connector rod.
6. Remove bowl cover with all parts attached.
7. Remove pump spring from pump cylinder in body.
8. Remove idle well plug assembly.
9. Remove idle well jet.
10. Remove idle adjusting screw and spring.
11. Remove metering rod jet assembly.
12. Remove nozzle passage plug assembly.

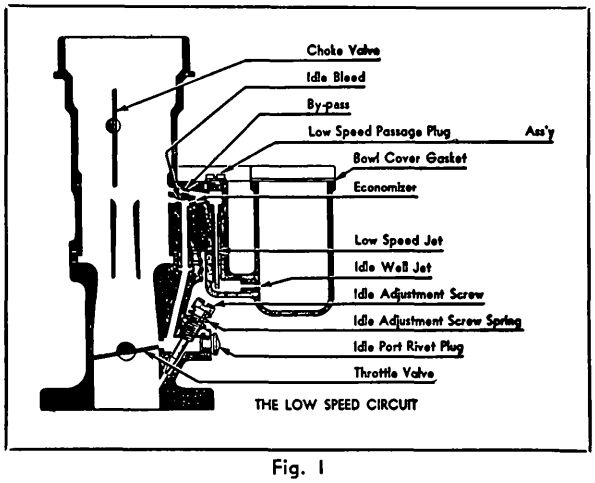

Fig. 1

13. Remove nozzle retainer plug.
14. Remove nozzle and nozzle gasket, using tool T109-178.
15. Remove body flange attaching screws and then remove flange from body.
16. **Remove strainer passage plug assembly and strainer.**
17. Remove intake ball check assembly.
18. Remove discharge disk check assembly.
19. Remove pump jet passage plug assembly.
20. Remove pump jet.
21. Remove throttle valve screws, throttle valve, retainer plate and throttle shaft and lever assembly.
22. Remove idle port rivet plug.
23. Remove choke tube bracket assembly.
24. Remove choke valve screws, choke valve and choke shaft and lever assembly.
25. Disassemble all parts from bowl cover.

Clean all castings thoroughly inside and out with a small brush and clean gasoline, or suitable solvent cleaner. Then blow all passages out with compressed air.

A. Group all parts controlling the gasoline level.
B. Group all low speed circuit parts.
C. Group all high speed circuit parts.

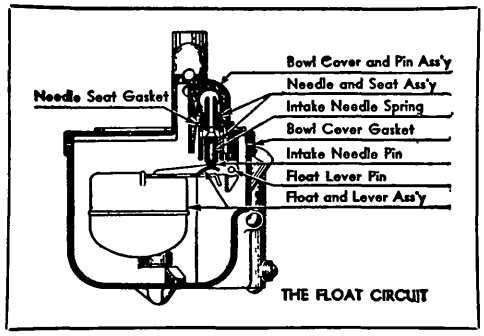

Fig. 2

D. Group all pump circuit parts.
E. Group all choke system parts.

Examine each part in each group and replace those parts that show sign of wear or damage. Clean all parts in gasoline and blow off with compressed air. If any carbon is in the bore of the flange, remove it by scraping or with sandpaper (do not use emery cloth). Install all parts tight.

TO REASSEMBLE

Assemble parts in group "A"

26. Install needle seat in bowl cover. Install bowl cover gasket. Put pin and spring into needle and install in seat; then install float and lever assembly.
27. Set float level. Turn gasket around so gauge can be placed on machined surface of casting. Correct setting is $\frac{3}{8}$". (Use tool T109-80.) Do not depress float lip against spring in needle, **but let float rest of its own weight.** Gauge should then be placed between free end of float and machined surface of bowl cover. Float should be set so it barely touches gauge. Adjustment is obtained by bending the lip on float which contacts pin in needle. Do not bend on front of float in adjusting, as damage will result.

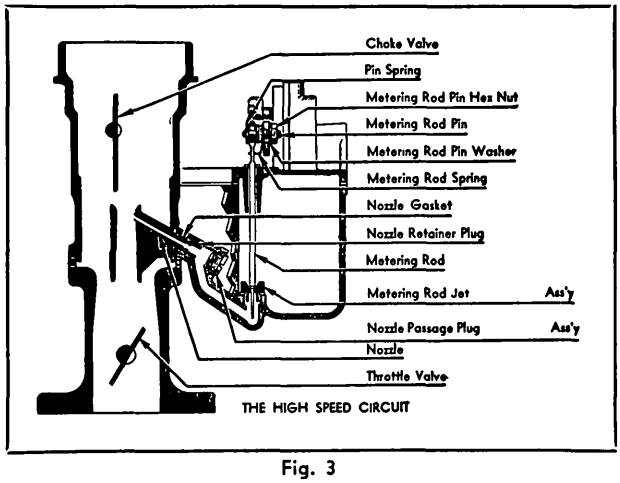

Fig. 3

CONVERSION FROM MANUAL TO GOVERNOR OPERATION (596S)

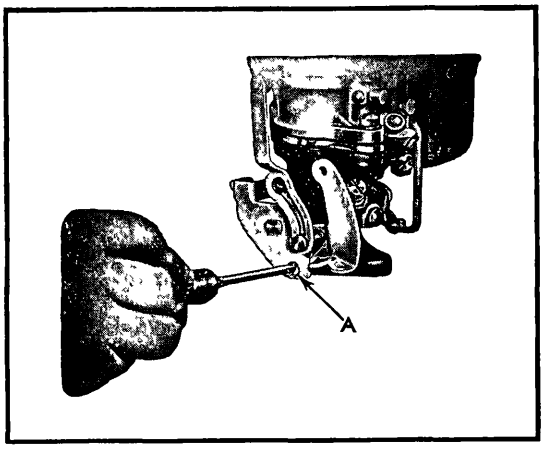

Fig. 7

The conversion from manual to governor control is very simple. Procedure is as follows:

1. Remove screw "A," Fig. 7.
2. Connect governor control rod to ball connector "B," Fig. 8.
3. Pull hand throttle control to wide open position. Governor can be made inoperative by closing hand throttle.

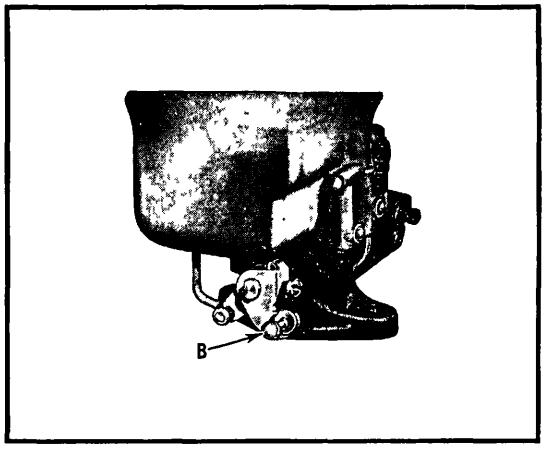

Fig. 8

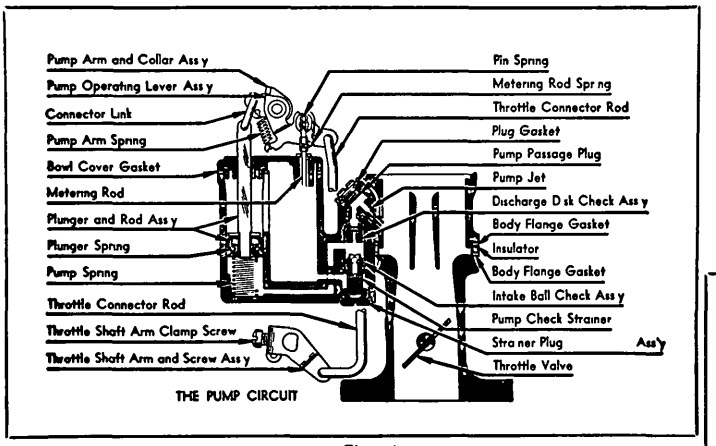

Fig 4

Assemble parts in group "D"

28 Install pump jet and pump jet plug assembly

29 Install discharge disk check assembly

30 Install intake ball check assembly

31 Install pump check strainer and strainer plug assembly

32 Install pump spring

33 Install pump plunger and rod assembly

Assemble parts in group "B"

34 Install loose lever and retainer plate and throttle shaft and lever assembly back out throttle lever adjusting screw, then install throttle valve and throttle valve screws (be sure trade mark on valve is toward the idle port when viewed from manifold side of flange) With valve screws loose tap throttle lightly to cen tralize it in bore of carbureter Hold valve in place with fingers and securely tighten screws (New screws are recommended)

35 Install idle port rivet plug

36 Install idle adjustment screw and idle adjustment screw spring

37 Install insulator and new gaskets then install body on flange tightening screws evenly and securely

38 Install idle well jet and idle well jet plug assembly

39 Install low speed jet Work jet well into seat by moving back and forth then install low speed jet plug assembly

Assemble parts in group "C"

40 Install metering rod jet assembly

41 Install bowl cover as assembled tightening screws down evenly and securely

42 Install pump arm and collar and pump operating lever assembly and spring on pin in bowl cover

43 Install pump connector link (ends away from bore and pin spring at top)

44 Install throttle shaft arm and screw assembly on throttle shaft

45 Install throttle connector rod in throttle shaft arm using spring and retainer at lower end and pin spring at top end

46 **Pump Adjustment**· Back out throttle lever set screw With throttle valve seated pump plunger should travel 17/64" from closed to wide open throttle Adjustment can be made by bending throttle connector rod at lower angle with tool T109 41 Pump travel can be measured by using universal pump stroke gauge T109 117S by placing base of gauge on raised portion of bowl cover so that projecting ear of pump gauge rests on top of pump shaft (See Fig 6) Hold gauge vertical The differ ence between the number shown by indext mark on gauge at wide open and closed throttle positions should be 17

47 **Metering Rod Adjustment** With shoulder on metering rod seated in metering rod jet metering rod pin must be adjusted to lightly contact top of metering rod eyelet with 015" to 018" opening between edge of throttle valve and bore of carbureter (side opposite idle port) Use gauge T109 44

47A **Optional Adjustment:** (See Fig 5) Correct setting of meter ing rod is important and must be made **after** pump adjust ment Install metering pin and spring assembly washer and nut loosely on pump operating lever Insert gauge (T109 26) in place of metering rod seating tapered end in metering rod jet With throttle valve **seated,** push metering rod pin downward until pin rests on shoulder of notch in gauge and tighten nut Remove gauge and install metering rod disc and pin spring Connect metering rod spring (end of spring through hole in metering rod)

48 **After adjustment,** metering rod should seat in metering rod jet when throttle is adjusted for normal curb idle Metering rod spring must exert slight downward pressure on metering rod Bend lower end of spring downward where necessary

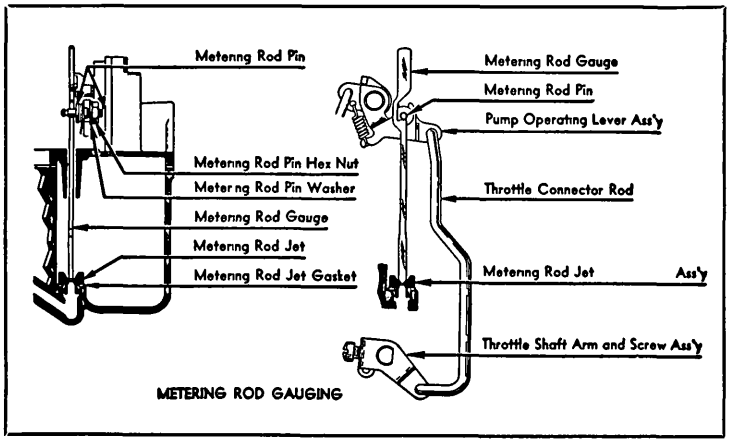

Fig 5

49 Install nozzle and nozzle gasket using tool No T109 55 Be sure that flat side of nozzle faces up

50 Install nozzle retainer plug and nozzle plug assembly

Assemble parts in group "E"

51 Install air horn on body

52 Install choke shaft and lever assembly and choke pull back spring

53 Install choke valve and screws centralizing the valve in air horn before tightening screws

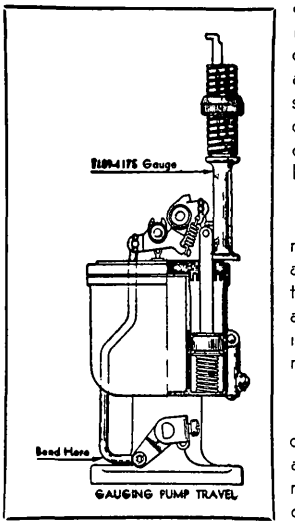
54 Install choke operating lever assembly and hook pull back spring in place

55 Install choke connector link connector link spring and pin spring

OTHER CARBURETER ADJUSTMENTS

If carbureter loads up after considerable service float level should be checked Wear on lip of float lever will raise float level Float level may be reset by bending lip of float lever down to raise float level or bending lever up to lower float level Only a very slight bend is needed

If motor stalls while idling reset throttle adjusting screw and idle adjustment screw to specifications If these adjustments do not cor rect the trouble (1) Remove idle well plug assembly allowing gaso line from the bowl to flush out idle well jet Remove low speed jet and blow out with compressed air (2) Remove idle well jet and clean thor oughly with compressed air Examine and see that jets seat gasoline tight at shoulder If not replace with new jets of identical specifications (3) Clean carbon accumulation from bore of car bureter around throttle valve



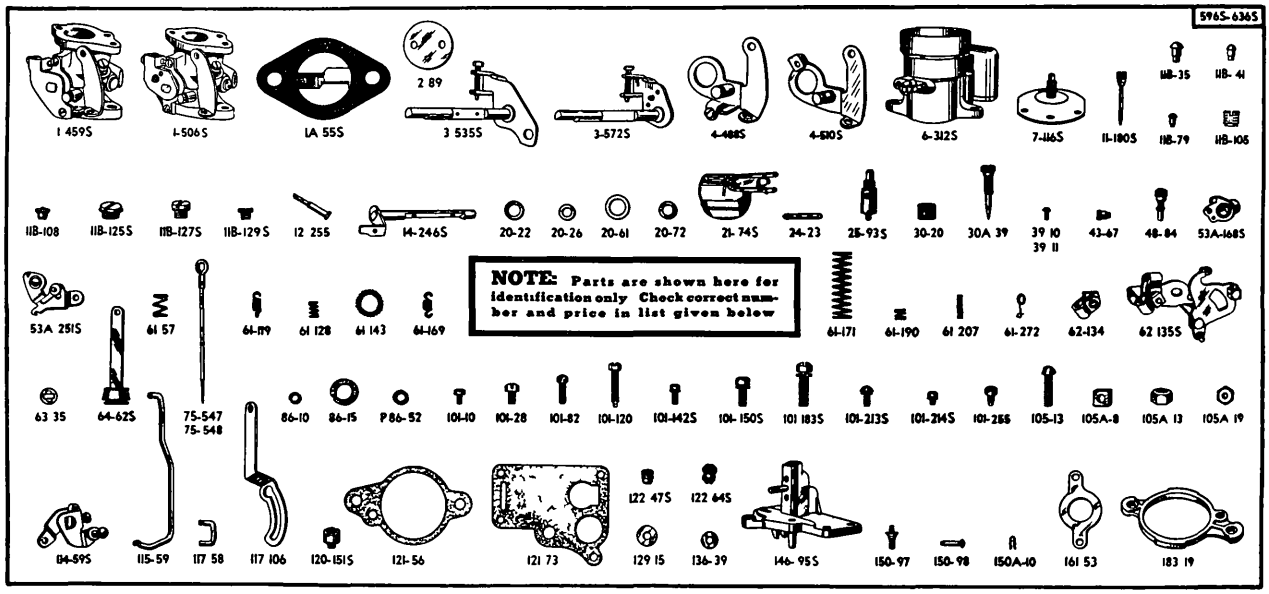


Fig 6

A clogged pump jet may be re moved and cleaned with compressed air which in many cases will remove the dirt or lint However it is usually advisable to replace the pump jet as its cost is nominal All jets and checks must be seated gasoline tight

Poor acceleration may be due to damaged or worn plunger leather in accelerating pump dirt in checks cor rosion or sediment in pump cylinder or bent throttle connector rod (parts which may be replaced at small cost)

WILLYS STATION SEDAN AND STATION WAGON SERIES "663" 1948-1949

WA-1 DOWN-DRAFT **CARBURETER No. 645S**

CARBURETER SPECIFICATIONS

For Willys 6 Cylinder Engine 3 Inch Bore 3½ Inch Stroke

Dimensions Flange size 1¼ inch S A E
Primary venturi 11/32 inch I D
Secondary venturi 11/16 inch I D

Main venturi 1 3/16 inch I D (early production) 1 166 inch I D (late production)

Float Level Distance from seam of float (at free end) to tip on lower edge of float chamber cover when needle is seated to be 5/16 inch

Vents Outside No 10 drill Inside none

Gasoline Intake Square vertical (spring loaded) needle Size No 48 drill hole in needle seat

Low Speed Jet Tube Jet size No 68 (.031") drill (11 160S)
No 66 (.033") drill (11 167S)
By pass size No 53 drill
Economizer 0755 0765 inch diameter
Idle bleed size No 49 drill

Idle port Slot type length 230 inch width 030 inch

Idle Port Opening 198 to 202 inch above valve with valve closed tight

Idle Screw Seat No 46 drill

Set Idle Adjustment Screw 1 to 2 turns open For richer mixture turn screw out Do not attempt to idle engine below 350 r p m

Main Nozzles In primary venturi angle 45° Angled tip Inside diameter No 30 drill Discharge jet size 086 inch diameter

Metering Rod Economy step 075 inch diameter middle step tapers to 071 inch diameter power step 050 inch diameter Length 3 9/64 inches

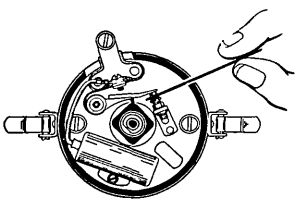
Metering Rod Jet 098 inch diameter

Metering Rod Setting Use gauge part No T109 102 (2 468 inches)

Accelerating Pump High pressure type (spring operated lever) with non adjustable pump stroke
Pump discharge jet size No 72 (.025") drill (48 61) No 71 (.026") drill (48 122)
Relief passage to outside size No 42 drill
Intake ball check seat size No 62 drill
Discharge ball check seat size No 32 drill

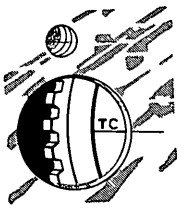
Pump Adjustment 11/64 inch plunger travel (full throttle position) Use gauge T109 117S

Choke Manual offset butterfly type interconnected to open throttle valve to fast idle position when choke is in use



Vacuum Spark Port 054 to 056 inch diameter Top of port 036 to 044 inch above valve

Motor Tune-Up—Be Accurate!



CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter

CARBURETER ADJUSTMENTS

Float Adjustment With bowl cover assembly inverted and float resting on pin in seated needle, the vertical distance from the projecting tip on edge of float chamber cover to soldered seam of float should be 5/16" Do not depress float lip against spring in needle but let float rest of its own weight Adjustment is made by bending lip of float which contacts pin in needle Do not bend front of float when adjusting as damage will result Use gauge T109-107

Pump Adjustment With pump connector link in place back out throttle lever adjusting screw to allow throttle valve to seat in bore of carbureter Place universal pump travel gauge T109 117S on bowl cover with projecting lip of gauge extending over pump link where it extends through pump plunger shaft Hold gauge vertical to insure correct readings Turn knurled nut of gauge until lip rests on pump link Read number on gauge indicated by notch in knurled nut Repeat with throttle in wide open position The difference in readings obtained at closed and at wide open throttle should be "11" (11/64") plunger travel Adjustment should be made by bending throttle connector rod at lower angle

Metering Rod Adjustment Correct setting of metering rod is important and must be made after pump adjustment Insert metering rod gauge T109-102 in place of metering rod Hold gauge vertical to insure seating tapered end in meter

ing rod jet With throttle valve seated, press down lightly on piston link (directly over piston) until lip of link touches pin in pump arm There should be less than 005" clearance between metering rod pin and shoulder in notch of gauge Adjust by bending lip on piston link (Use tool T109-105) Remove gauge and install metering rod and disc Connect metering rod and spring

Anti-Percolator Adjustment Crack throttle 030" by placing gauge T109-29 between throttle valve and bore of carbureter, side opposite idle port Bend rocker arm lip until there is 005" to 015" clearance between rocker arm and pump arm With gauge removed, anti-percolator valve should be slightly open when throttle valve is seated.

Willys—1948-1949—Carbureter 645S

CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

PRINTED IN U.S.A.

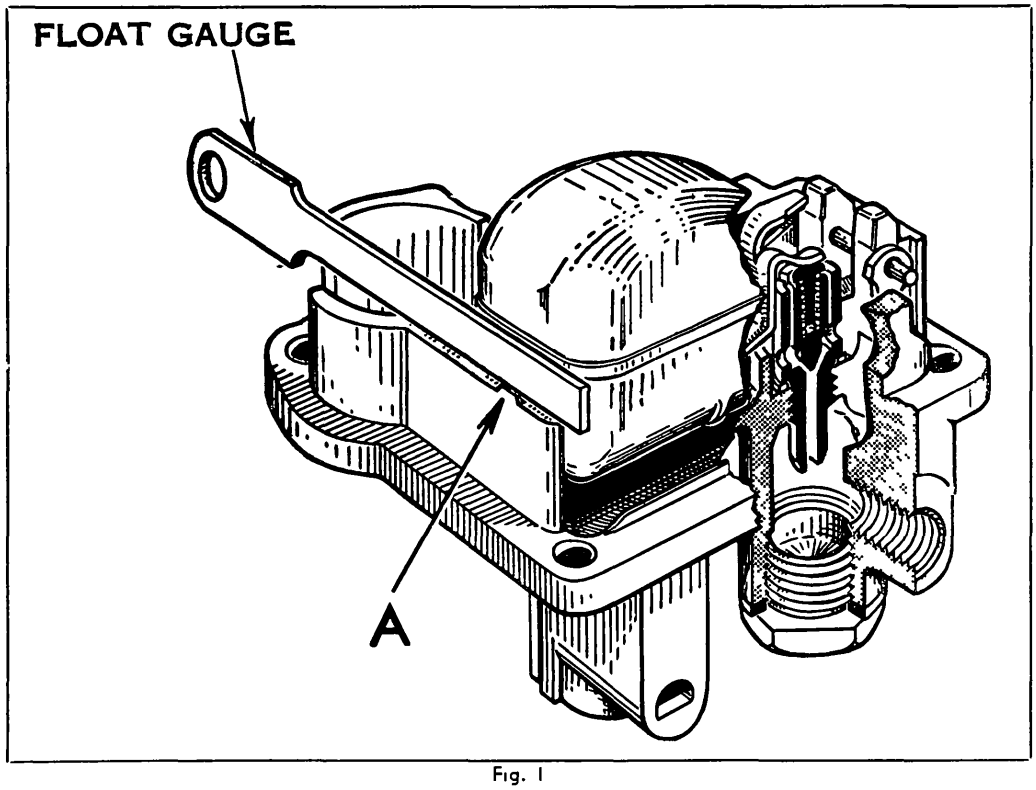

Fig. 1

CARBURETER ADJUSTMENTS

Adjustments must be made in the following order:

1. **FLOAT ADJUSTMENT**· With bowl cover assembly inverted and float resting on pin in seated needle, the vertical distance from the projecting tip on edge of float chamber cover (A) to soldered seam of float should be 5/16" (Fig 1). Do not depress float lip against spring in needle **but let float rest of its own weight.** Adjustment is made by bending lip of float which contacts pin in needle Do not bend front of float when adjusting as damage will result Use gauge T109-107

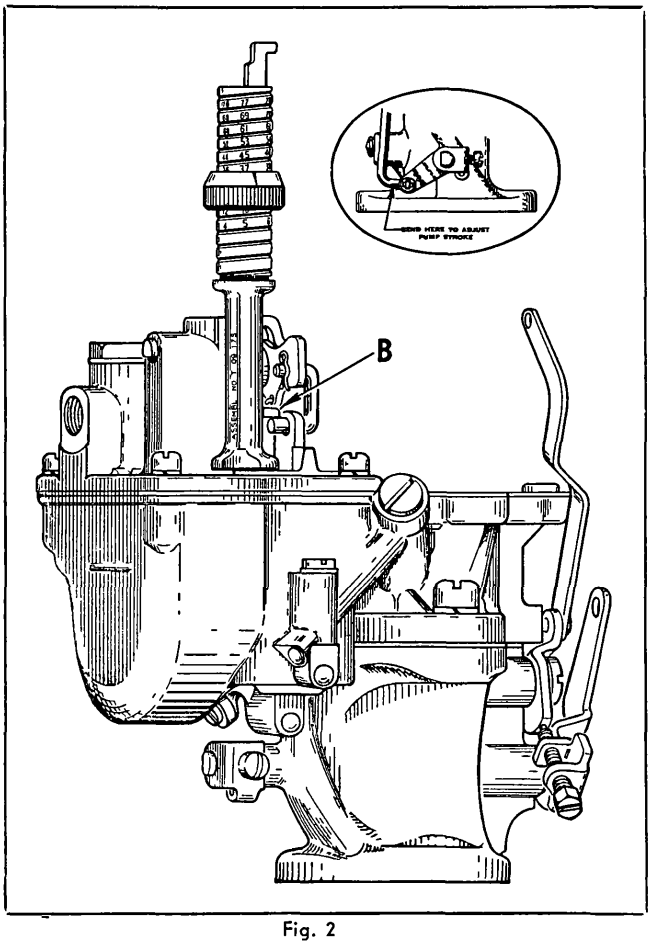

Fig. 2

2 **PUMP ADJUSTMENT:** With pump connector link in place back out throttle lever adjusting screw to allow throttle valve to seat in bore of carbureter Place universal pump travel gauge T109 117S on bowl cover with projecting lip of gauge extending over pump link where it extends through pump plunger shaft (B) (Fig 2) Hold gauge vertical to insure correct readings. Turn knurled nut of gauge until lip rests on pump link Read number on gauge indicated by notch in knurled nut Repeat with throt tle in wide open position The difference in readings obtained at closed and at wide open throttle should be "11" (11/64" plunger travel) Adjustment should be made by bending throttle connector rod at lower angle (Insert, Fig 2)

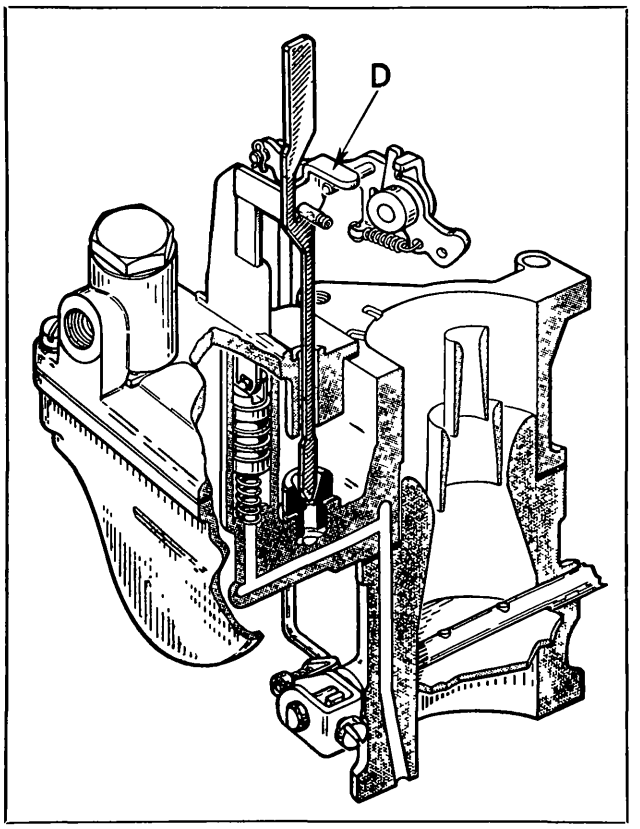

Fig. 3

3. METERING ROD ADJUSTMENT: Correct setting of metering rod is important and must be made **after pump adjustment.** Insert metering rod gauge T109-102 in place of metering rod Hold gauge vertical to insure seating tapered end in metering rod jet (Fig 3) With throttle valve seated press down lightly on piston link (directly over piston) until lip of link touches pin in pump arm There should be less than 005" clearance between metering rod pin and shoulder in notch of gauge Adjust by bending lip on piston link (D) (use tool T109-105) Remove gauge and install metering rod and disc Connect metering rod and spring

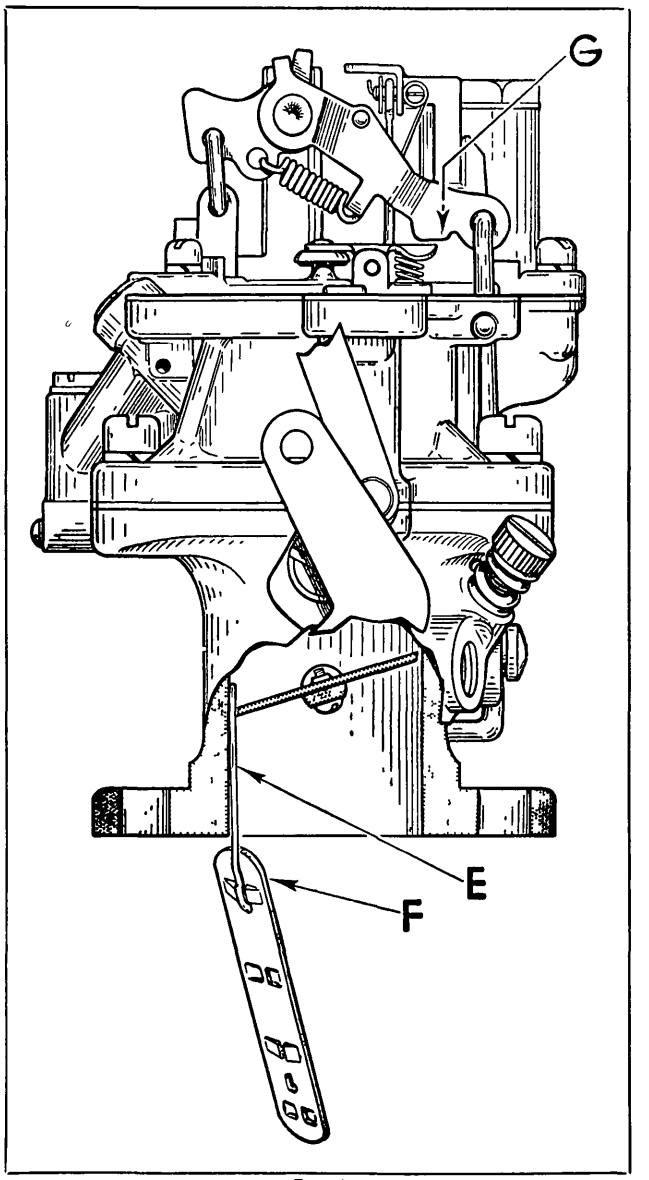

Fig. 4

4. ANTI-PERCOLATOR ADJUSTMENT: Crack throttle 030" (E) by placing gauge T109-29 (F) between throttle valve and bore of carbureter, side opposite idle port (Fig 4). Bend rocker arm lip until there is 005" to 015" clearance between rocker arm and pump arm (G) With gauge removed anti percolator valve should be slightly open when throttle valve is seated

FLANGE GASKETS: The metering rod is controlled by a combination of intake manifold vacuum and throttle position It is known as 'Vacumeter' or Vacuum controlled metering rod A sudden opening of throttle allows the vacuum piston spring to push metering rod upward allowing ample fuel for accelerating purposes to flow through metering rod jet During part throttle and idle operation the metering rod is forced downward against the upward pressure of the vacuum piston spring returning the metering rod to a position controlled by the lip on vacuum piston link contacting the pin on the pump arm. This method of control allows greater economy at constant throttle operation with better metering of fuel for acceleration purposes

The vacuum passage to the Vacumeter cylinder enters the carbureter at the flange face and requires the use of the slotted type flange gasket shown in Fig 5 When a governor is used between the carbureter and manifold the four hole type flange gasket shown in Fig 6 must be used between carbureter and governor and the slotted type gasket used between the governor and the manifold **NEVER USE A SOLID TYPE GASKET WHEN SERVICING THIS CARBURETER.**

CARBURETER SPECIFICATIONS

Dimensions: Flange size 1 inch S A E (800S-SA 801S-SA, 2726S, 2727S) 3/4 inch S A E (802S-SA, 803S-SA, 2728S, 2729S) Throttle bore 1-1/16 inch
(801S-SA 803S SA, 2727S 2729S) Main venturi, 21/32 inch
(800S-SA 802S-SA 2726S, 2728S) Main venturi, 23/32 inch

Float Setting: See illustration at bottom of page

Vents: Outside, none Inside balance vent No 12 (.189 inch) drill.

Gasoline Intake Needle: Square vertical needle, size No. 48 (.076 inch) drill in needle seat.

Low Speed Jet Tube: Jet size, No. 66 (.033 inch) drill.
Idle bleed: No. 56 (.0465 inch) drill.
Economizer· No 65 (.035 inch) drill.

Idle Ports: Lower port, slot type, round end, .049 to .051 inch by .029 to .031 inch wide
Bottom of port 044 to .048 inch below lower edge of valve

Upper port .038 to 042 inch diameter (for idle adjustment screw).

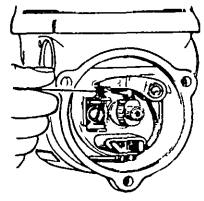
Idle Adjustment Screw. For leaner mixture, turn screw in. For richer mixture turn screw out. Do not idle engine below 400 r.p.m.

Main Metering Jet: Adjustable maximum mixture usually obtained with 3 turns open.

Nozzle: In primary venturi, angle 24° from vertical. Inside diameter No 44 (.086 inch) drill.
Accelerating Jets 2—No. 64 (.036 inch) drill 21/64 inch from shoulder
2—No. 64 (.036 inch) drill 27/32 inch from shoulder.

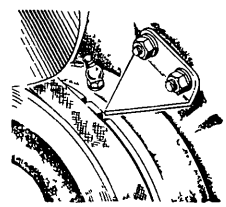
Air Bleed to Nozzle: (Thru plug) No. 64 (.036 inch) drill.

Choke: Manual—With locking device for magneto equipped units Butterfly type with poppet valve

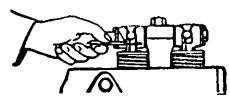


Vacuum Spark: None

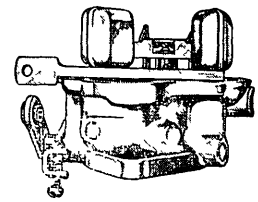
Motor Tune-Up—Be Accurate!



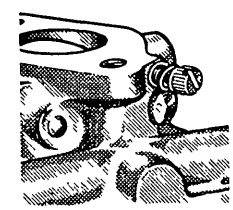
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap



Set Breaker Points



Adjust Ignition Timing Use Timing Light

Set Valves to Specification

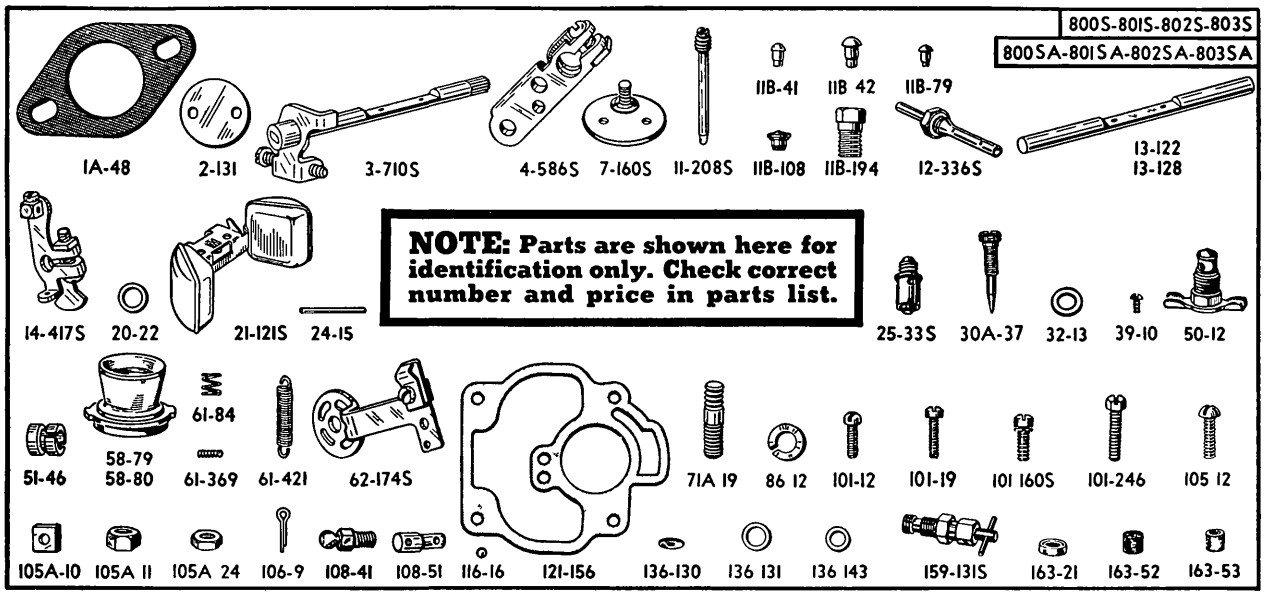
CARBURETER ADJUSTMENTS

To secure a good idle Set throttle lever adjusting screw until motor runs approximately 450 r p m Then set idle adjustment screw for highest steady vacuum gauge reading or smoothest engine operation



High Speed Adjustment If the engine is normally governed at a speed lower than 1600 r p m disconnect the governor With engine operating at normal temperature set the throttle manu ally for an engine speed of approximately 1600 r p m Open or close the high speed adjusting needle until engine operates smoothly

A slight revision of the idle and high speed adjustment may be necessary for smooth governed speed operation

If motor loads—check float level Wear on lip of float lever will raise float level causing carbureter to load up. To lower float level, bend float lever toward needle To raise float level bend lip away from needle A very slight bend is sufficient Bend lip of float only not bracket Be sure float is installed with lip of float against needle

Maximum performance can be secured only when breaker points spark plugs valves and motor timing are set to manufacturer s specifications

If carbureter does not respond to the above adjustments, dis assemble clean all parts in carbureter cleaner rinse and blow out all passages with compressed air. Replace all worn or damaged parts Always use new gaskets See form No 3525 for complete overhaul procedure

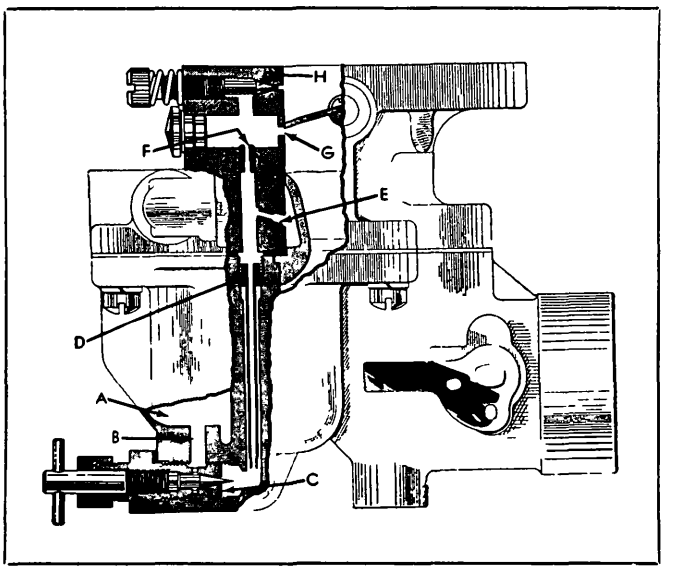

Figure 1

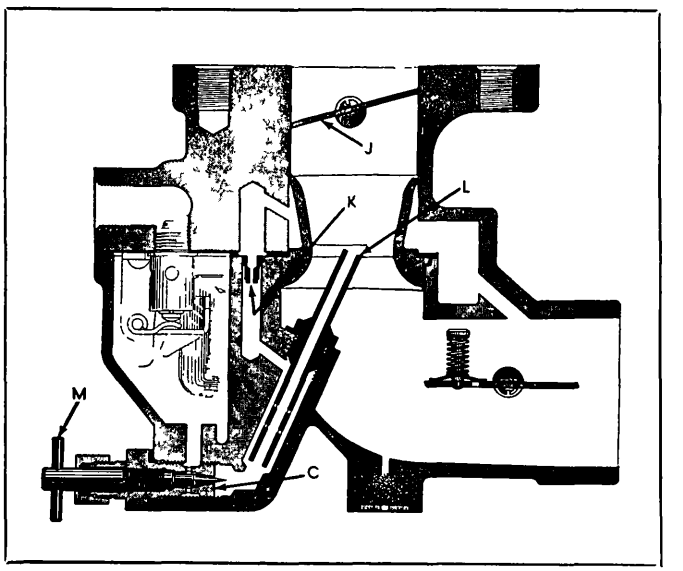

Figure 2

BRIEF CARBURETER DESCRIPTION

Model UT Universal

LOW SPEED CIRCUIT (See Figure 1)

Fuel for idle and low speed operation is drawn from the fuel bowl (A) through fuel passage (B) past main metering jet (C) up channel and through idle jet (D) and is mixed with air from idle air bleed (E) This relatively rich mixture passes through the economizer (F) Part of it then passes into the carbureter bore through idle port (G) and the balance enters the bore past the idle adjustment screw (H) Clockwise rotation of the idle adjustment screw which controls the amount of fuel air mixture leans the mixture while turning the screw counterclockwise richens it **NOTE DO NOT ATTEMPT TO REMOVE IDLE AIR BLEED (E) AND ECONOMIZER (F)**

HIGH SPEED CIRCUIT (See Figure 2)

The main metering jet (C) supplies the amount of fuel required for high speed operations As the carbureter throttle valve (J) is opened (beyond idle speed requirements) high velocity air passing through the carbureter throat creates a suction at the main nozzle outlet This causes fuel to flow from the fuel bowl through main metering jet (C) where it mixes with air from the nozzle bleed (K) This fuel air mixture passes through main nozzle (L) and into air stream at carbureter throat Clockwise adjustment of the main metering screw (M) which controls the amount of fuel leans the mixture Maximum mixture is usually obtained with three turns open **NOTE DO NOT ATTEMPT TO REMOVE NOZZLE BLEED (K)**

FLOAT SETTING

Float setting is illustrated and specified at the bottom of page 1 This is the distance from the top of the float to the machined surface of the casting (Invert for gauging)

CARBURETER ADJUSTMENTS

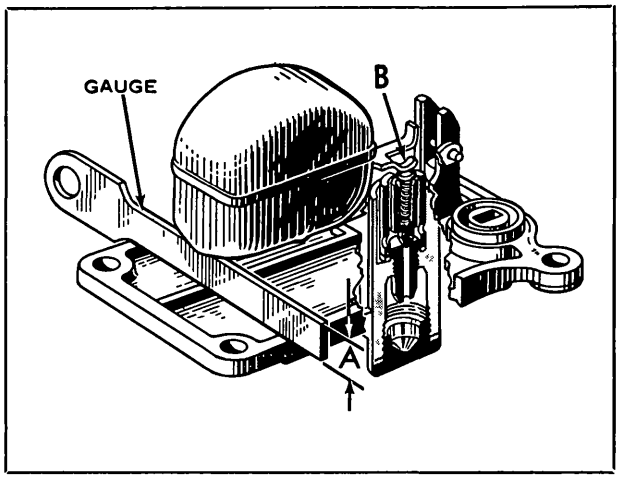

Figure 1
Float Adjustment

FLOAT ADJUSTMENT (Fig. 1):

With bowl cover assembly inverted and float resting on pin in seated needle, and with gasket removed, the distance from the bowl cover to the top of the float should be 1/2 inch (A) (Gauge T109 83) (431S-SA-SD), 3/8 inch (A) (Gauge T109-80) (853S) Do not depress float lip (B) against spring loaded pin in needle but let float rest of its own weight Adjust by bending lip of float not float arm Float setting must be checked with the bowl cover held at eye height in a level position

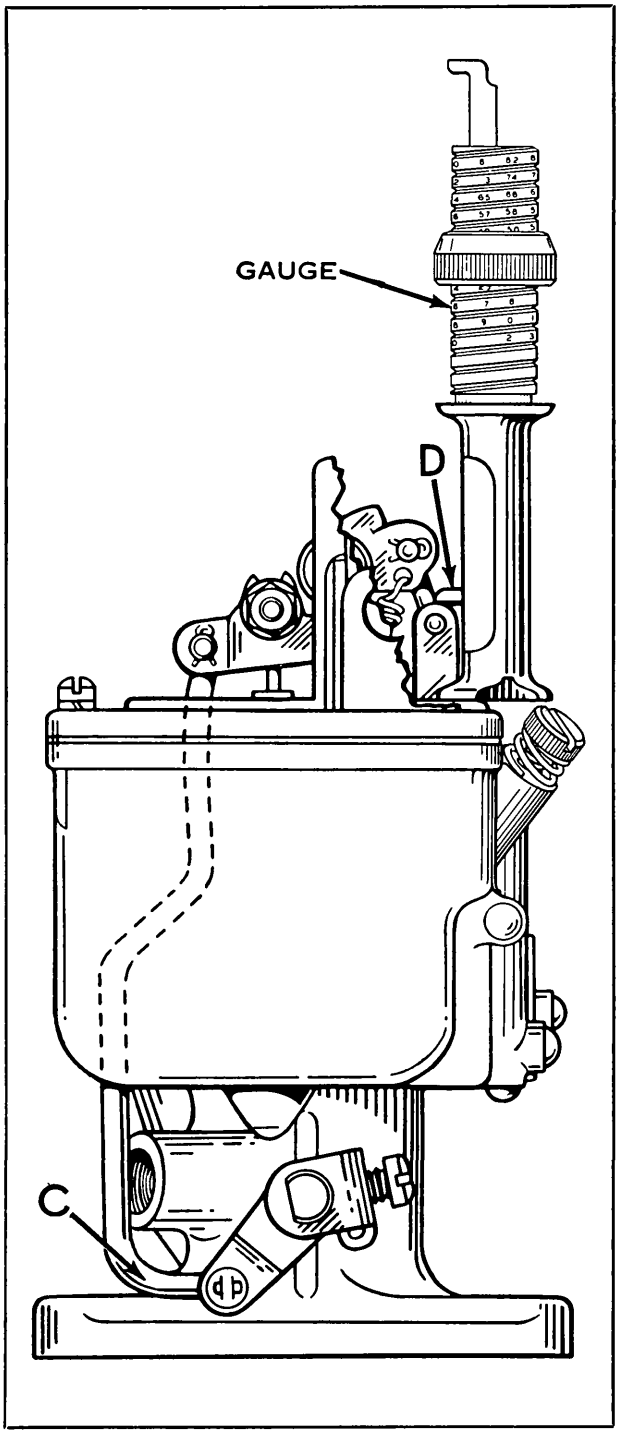

Figure 2
Pump Adjustment

PUMP ADJUSTMENT (Fig. 2):

Back out throttle lever set screw With throttle valve seated, pump should travel 12/64 inch (431S-SA-SD); 14/64 inch (853S) from closed to wide open position Adjustment can be made by bending throttle connector rod at lower angle (C) with tool T109-213 Pump travel can be measured by using universal stroke gauge T109-117S, by placing base of gauge on raised portion of bowl cover so that projecting ear of pump gauge rests on top surface of pump shaft (D) Hold gauge vertical The difference between the number shown by index mark on gauge at wide open and closed position, should be "12" (431S-SA-SD); "14" (853S).

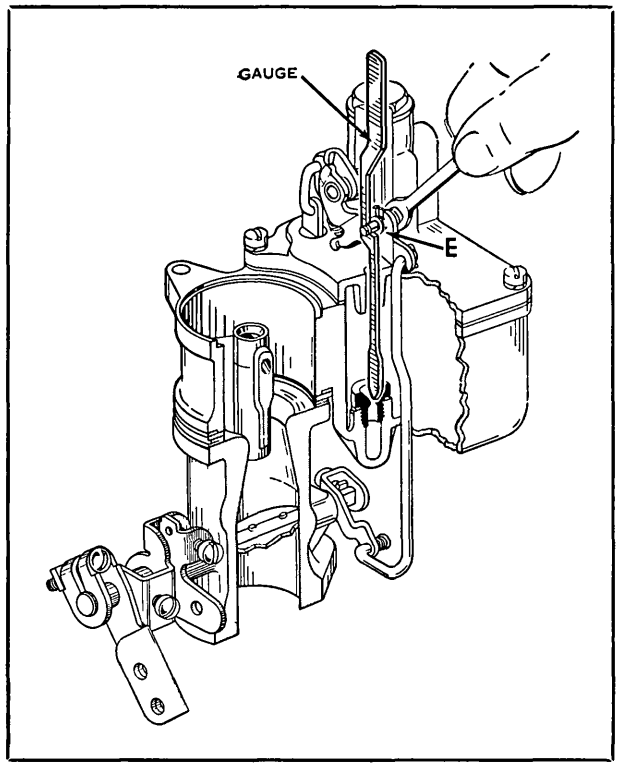

Figure 3
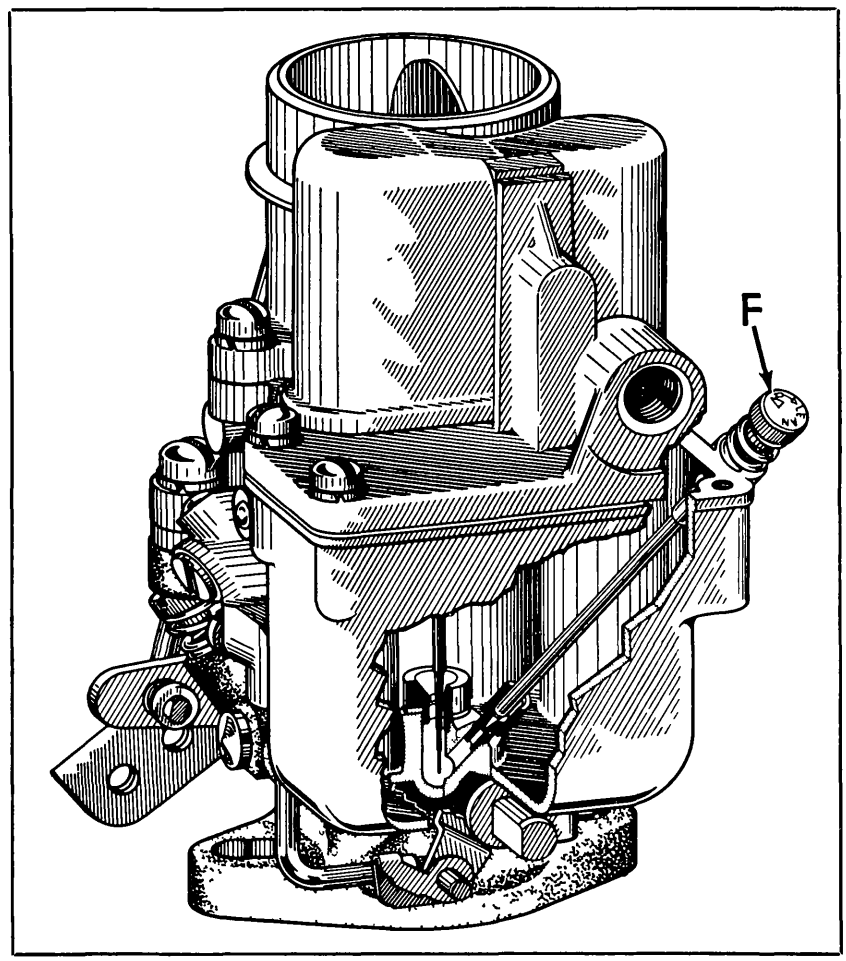
Metering Adjustment

METERING ROD ADJUSTMENT (Fig 3)

Correct setting of metering rod is important and must be made after pump adjustment Install metering rod pin and spring assembly washer and nut loosely on pump operating lever (E) Insert gauge (tool T109-26) in place of meter ing rod seating tapered end in metering rod jet Hold gauge vertical to insure seating With throttle valve seated push metering rod pin (E) even with shoulder of notch in gauge and tighten nut (tool T109 76) Remove gauge and install metering rod disk and pin spring Connect meter ing rod spring

HIGH SPEED ADJUSTMENT (Fig 4):

With motor warm and throttle set to a speed equivalent to 30 m p h on road High speed needle (F) should be screwed in until motor begins to slow down then back needle out until motor reaches maximum speed (A leaner mixture is obtained by turning high speed needle in To richen the mixture turn needle out)



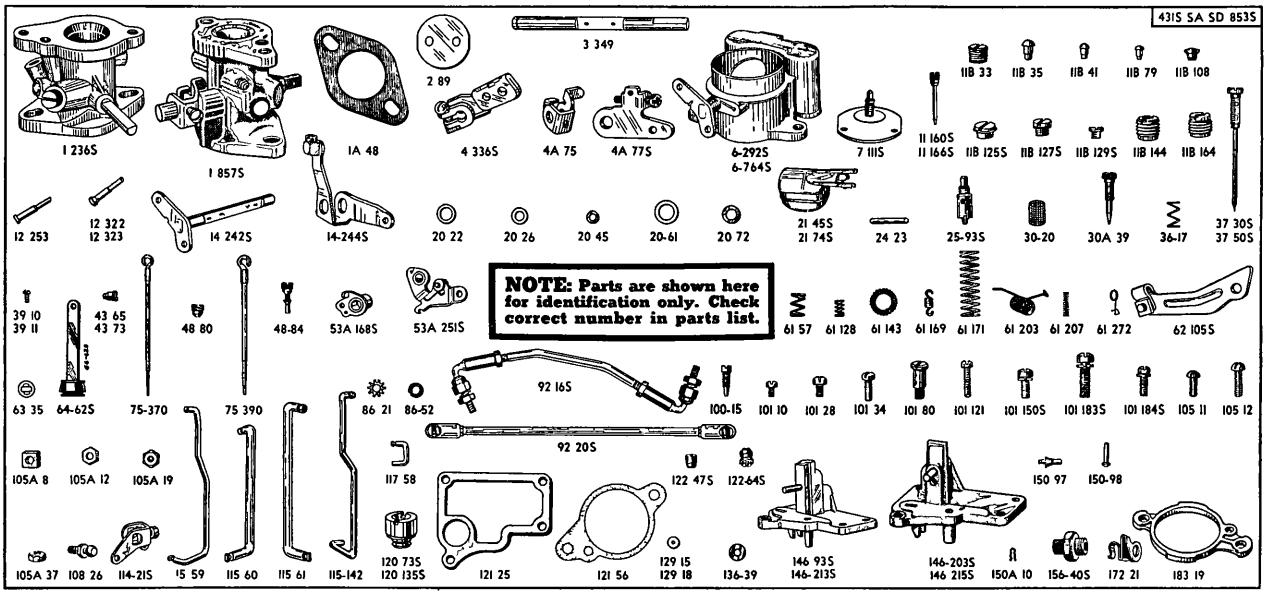


Figure 4
High Speed Adjustment

CARTER CARBURETOR
DIVISION OF acf INDUSTRIES INCORPORATED
ST. LOUIS, MO., U. S. A.

BBR2-692S
October, 1948
Revised February, 1956

SPECIAL HEAVY DUTY APPLICATION

(1½ Inch S. A. E. Flange)

BBR2 DOWN-DRAFT **CARBURETER No. 692S**

CARBURETER SPECIFICATIONS

Dimensions: Flange size, 1½ inch S. A. E.
Throttle bore, 1-11/16 inch (42.86 mm).
Main venturi, 1-11/32 inch (34.13 mm) I. D.

Float Setting: Top of float 5/64 inch (1.98 mm) below top surface of carbureter body casting. (Plus or minus 1/64 inch) (.397 mm).

Vents: Outside, none. Inside balance vent .218 inch diameter (5.54 mm).

Gasoline Intake Needle: Triangular, horizontal. No. 42 (2.37 mm) drill in needle seat.

Idle Orifice Tube: Jet size, .0276 inch (.70 mm) drill. Idle passage air bleed (in body) size .063 inch (1.60 mm) diameter. Economizer in body—size .055 inch (1.38 mm) diameter.

Idle Ports: Upper port. Keyhole type; length, .128 inch (3.25 mm); width, .027 inch (.69 mm); .063 inch (1.60 mm) diameter hole at top.
Top of port located .088 to .092 inch (2.24 to 2.34 mm) above top edge of valve.
Lower port size, .053 to .057 inch (1.35 to 1.45 mm) drill. (For idle adjustment screw.)

Set Idle Adjustment Screw: 1 to 2 turns open. For richer mixture turn screw out. Do not idle engine below 400 r.p.m. or 6 miles per hour.

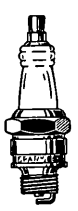
Main Metering Screw: Calibrated to flow 236 to 240 cc per minute. (Do not gauge for size. If in doubt, replace with new part.)

Main Vent: Through diffuser (air bleed inside bowl), size .0315 inch (.80 mm) drill.

Main Vent Tube: Side holes:
2—.0354 inch (.90 mm), approximately 1-1/32 inch (38.10 mm) from end.
2—.0354 inch (.90 mm), approximately 1-23/32 inch (43.66 mm) from end.

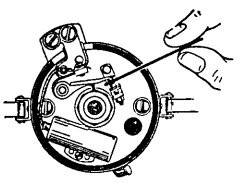
Step-Up Jet: Size, .0413 inch (1.05 mm) drill.

Accelerating Pump: Type, delayed action. Stroke: Summer setting (inner hole, short stroke).
Intermediate setting (center hole).
Winter setting (outer hole, long stroke).
Pump intake seat, size .115 to .120 inch (2.93 to 3.05 mm) diameter in body. Pump discharge passage: restriction (under ball check), size .062 to .065 inch (1.57 to 1.65 mm) diameter in body. Pump (discharge) jet size .0374 inch (.95 mm) drill.



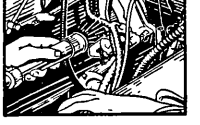
Pump Adjustment: 26/64 inch plunger travel; full throttle position, medium stroke. Use gauge T109-117S.

Choke: Butterfly type, with poppet valve. Interconnected to open throttle valve to fast idle position when choke is used.

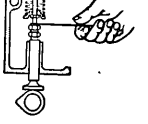


Vacuum Spark Port: Slot (round end) type. Size .040 by .110 inch (1.016 by 2.794 mm). Top of port .035 to .041 inch (.89 to 1.04 mm) above top edge of valve.

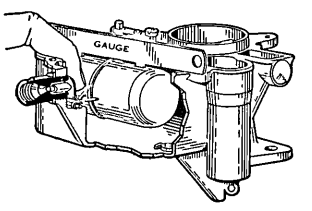
Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



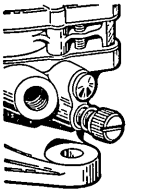
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap



Set Breaker Points



Adjust Ignition Timing Use Timing Light

Set Valves to Specification

Float Setting (Use Gauge) 5/64 Inch

Idle Adjustment Screw Setting 1 to 2 Turns Open

THESE ADJUSTMENTS MUST BE ACCURATE AND IN CONFORMITY WITH CAR MANUFACTURER'S SPECIFICATIONS

CARBURETER ADJUSTMENTS

For most satisfactory starting during extremely cold weather, pull out choke, crack throttle about ⅛ to ¼ open and then engage starter.

If carbureter loads up after considerable service, check float level. Wear on lip of float lever will raise float level. Before adjusting float, be sure float lever pin is firmly seated. Reset by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level. Bend vertical lip of float only.

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 400 r.p.m. Then set idle adjustment screw to specifications. If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly and clean tube and passages with compressed air.

If acceleration is not satisfactory, remove pump jet and clean with compressed air; however, it is usually advisable to replace the pump jet, as its cost is nominal. All jets must be seated gasoline tight. Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged ball check at bottom of pump cylinder and discharge ball check in discharge passage. If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather.

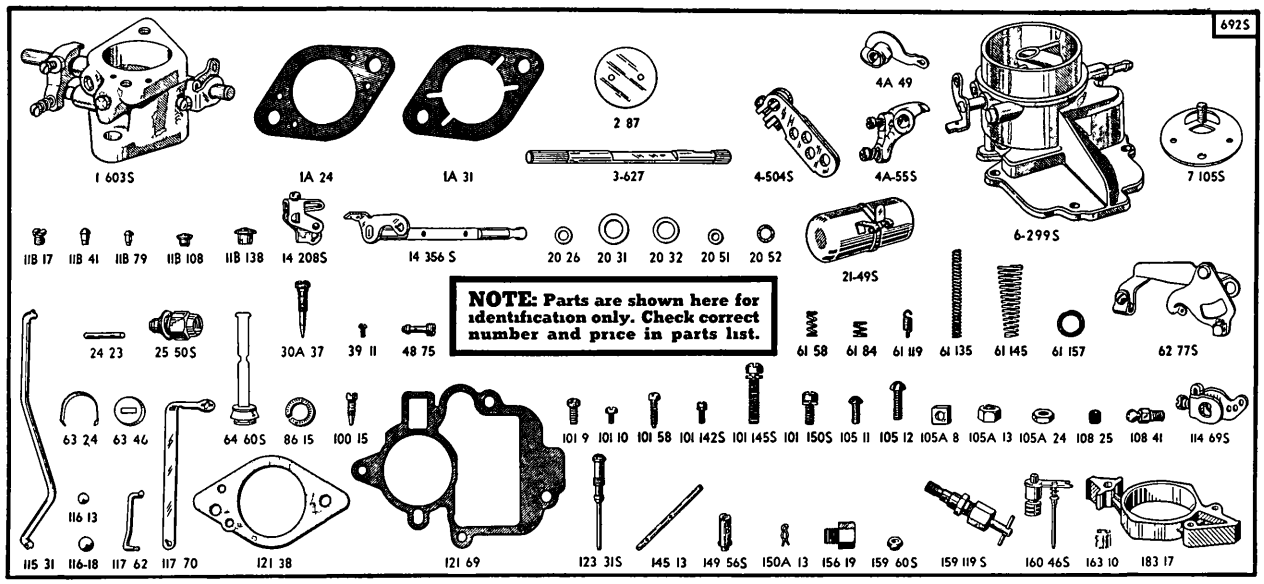
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.



Correct air fuel ratio is provided by a 'balance tube located in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of main metering screw assembly beneath float bowl main vent tube can be removed and a new tube inserted with tool T109 195 Care must be exercised in inserting new tube which must seat tightly

Pump Adjustment Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in center hole (medium stroke) of throttle shaft arm Place base of pump travel gauge T109-117S on upper edge of body casting at pump cylinder With throttle valve seated turn gauge until projecting finger contacts top of plunger shaft Note number indicated on gauge Repeat with throttle valve wide open and plunger pressed to bottom of the cylinder The difference between the numbers indicated at wide open and closed throttle positions should be 26 (26/64") pump stroke Adjust by bending horizontal portion of pump lifter link This pump is also adjustable for seasonal driving Set to longest stroke (outer hole) for cold weather short stroke (inner hole) for hot weather driving or altitude conditions

Idle Adjustment With engine at normal operating temperature and vacuum gauge attached to intake manifold, idle engine at approximately 400 r p m and turn idle adjustment screw until highest steady vacuum reading is obtained Then slowly open adjusting screw to the point where vacuum just begins to decrease

Main Metering Screw Adjustment Using a tachometer and with engine operating at normal temperature adjust throttle for an engine speed of approximately 2 000 r p m Open main metering screw until engine operates smoothly with the highest vacuum gauge reading Slowly tighten main metering screw until a slight reduction of engine speed can be noticed or vacuum gauge shows slight decrease Open screw slightly from this position until maximum speed is obtained—usually not more than ⅛ to ¼ turn Hold screw securely and tighten nut to lock screw in position

Carbureter No. 692S

Gasoline Intake Needle Triangular horizontal No 44 (2 18 mm) drill in needle seat

Idle Orifice Tube Jet size 031 inch (79 mm) drill Idle passage air bleed (in body) size 0635 inch (1 61 mm) diameter Economizer in body—size 0545 inch (1 38 mm) diameter

Idle Ports Upper port Slot type length 175 inch (4 45 mm) width 030 inch (76 mm)
Top of port located 138 to 142 (3 50 to 1 61 mm) above top edge of valve
Lower port size 053 to 057 inch (1 35 to 1 45 mm) drill (For idle adjustment screw)

Set Idle Adjustment Screw ½ to 1½ turns open For richer mixture turn screw out Do not idle engine below 400 r p m or 6 miles per hour

Main Metering Screw Calibrated to flow 146 to 150 cc per minute (Do not gauge for size If in doubt replace with new part)

Main Vent Through diffuser (air bleed inside bowl) size 040 inch (1 01 mm) drill

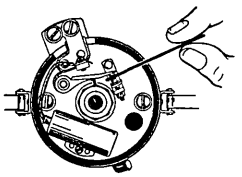
Main Vent Tube Side holes
2—0354 inch (90 mm) 21/64 inch (8 33 mm) from end
2—0354 inch (90 mm) 1 1/64 inch (25 8 mm) from end
2—0354 inch (90 mm) 1 33/64 inch (38 5 mm) from end

Step up Jet Size 0394 inch (1 00 mm) drill

Accelerating Pump Type delayed action Stroke Summer setting (inner hole short stroke)
Intermediate setting (center hole)
Winter setting (outer hole long stroke)
Pump intake passage size 115 to 120 inch (2 93 to 3 05 mm) diameter in body Pump discharge passage restriction (under ball check) size 062 to 065 inch (1 57 to 1 65 mm) diameter in body Pump (discharge) jet size 0276 inch (70 mm) drill

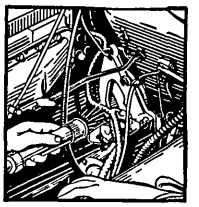
Pump Adjustment 24/64 inch plunger travel full throttle position medium stroke Use gauge T109 117S

Choke Butterfly type with poppet valve Interconnected to open throttle valve to fast idle position when choke is used

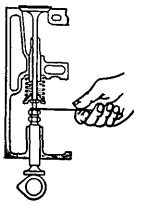


Vacuum Spark Port Slot (round end) type Size 040 by 110 inch (1 016 by 2 794 mm) Top of port 017 to 023 inch (43 to 58 mm) above top edge of valve

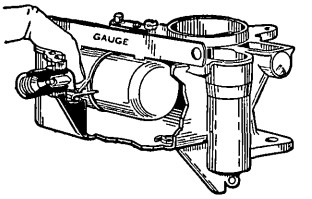
Motor Tune-Up—Be Accurate!



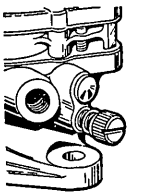
CAUTION Change worn or leaky flange gaskets Tighten manifold bolts and test compression before adjusting carbureter.



Spark Plug Gap



Set Breaker Points



Adjust Ignition Timing Use Timing Light

Set Valves to Specification

Float Setting (Use Gauge) 5/64 inch

Idle Adjustment Screw Setting ½ to 1½ Turns Open

THESE ADJUSTMENTS MUST BE ACCURATE AND IN CONFORMITY WITH CAR MANUFACTURER'S SPECIFICATIONS

CARBURETER ADJUSTMENTS

For most satisfactory starting during extremely cold weather, pull out choke, crack throttle about ⅛ to ½ open and then engage starter

If carbureter loads up after considerable service, check float level Wear on lip of float lever will raise float level Before adjusting float, be sure float lever pin is firmly seated Reset by bending lip of float lever away from needle to raise level, or bend lip toward needle to lower float level Bend vertical lip of float only

If motor stalls while idling, set throttle lever adjusting screw so motor runs approximately 400 r p m Then set idle adjustment screw to specifications If these adjustments do not correct the trouble, remove idle orifice tube and plug assembly and clean tube and passages with compressed air

If acceleration is not satisfactory, remove pump jet and clean with compressed air, however, it is usually advisable to replace the pump jet, as its cost is nominal All jets must be seated gasoline tight Poor acceleration may be due to damaged or worn plunger leather in accelerating pump, sediment in pump cylinder or clogged ball check at bottom of pump cylinder and discharge ball check in discharge passage If plunger is removed from cylinder, use care in installing to avoid damage to plunger leather

Correct air fuel ratio is provided by a "balance tube located in the air horn The balance tube should be checked each time the carbureter is serviced to see that the passage is open The object of a balanced carbureter is to provide a constant air fuel ratio regardless of type, size or condition of air cleaner Should the cleaner become clogged the capacity will be reduced but the air-fuel mixture ratio will not be changed

Excessive richness above 50 miles per hour may be caused by a clogged main vent tube After removal of main metering screw assembly beneath float bowl, main vent tube can be removed and a new tube inserted with tool T109-195 Care must be exercised in inserting new tube which must seat tightly

Pump Adjustment Remove air horn assembly, back out throttle lever adjustment screw and install pump operating link in center hole (medium stroke) of throttle shaft arm Place base of pump travel gauge T109-117S on upper edge of body casting at pump cylinder With throttle valve seated turn gauge until projecting finger contacts top of plunger shaft Note number indicated on gauge Repeat with throttle valve wide open and plunger pressed to bottom of the cylinder The difference between the numbers indicated at wide open and closed throttle positions should be '24 (24/64') pump stroke) Adjust by bending horizontal portion of pump lifter link This pump is also adjustable for seasonal driving Set to longest stroke (outer hole) for cold weather short stroke (inner hole) for hot weather driving or altitude conditions

Idle Adjustment With engine at normal operating temperature and vacuum gauge attached to intake manifold idle engine at approximately 400 r p m and turn idle adjustment screw until highest steady vacuum reading is obtained Then slowly open adjusting screw to the point where vacuum just begins to decrease

Main Metering Screw Adjustment Using a tachometer and with engine operating at normal temperature adjust throttle for an engine speed of approximately 2 000 r p m Open main metering screw until engine operates smoothly with the highest vacuum gauge reading Slowly tighten main metering screw until a slight reduction of engine speed can be noticed or vacuum gauge shows slight decrease Open screw slightly from this position until maximum speed is obtained—usually not more than ⅛ to ¼ turn Hold screw securely and tighten nut to lock screw in position

CARBURETER SPECIFICATIONS

Dimensions: Flange size, (590S-591S) 1¼ inch S. A. E.
(592S) 1½ inch S. A. E.
Throttle bore, (590S) 1-5/32 inch (29.37 mm).
(591S) 1-7/16 inch (36.51 mm).
(592S) 1-11/16 inch (42.86 mm).
Main venturi, (590S) 1-3/32 inch (27.78 mm).
(591S) 1¼ inch (31.75 mm).
(592S) 1-9/32 inch (32.54 mm).

Float Setting: (All models) Top of float 5/64 inch (1.98 mm) below top surface of carbureter body casting, plus or minus 1/64 inch (.397 mm).

Vents: (All models) Outside, none. Inside, balance vent .218 inch (5.56 mm) diameter.

Gasoline Intake Needle: Triangular, horizontal.
(590S) No. 48 (1.93 mm) drill in needle seat.
(591S-592S) No. 44 (2.18 mm) drill in needle seat.

Idle Orifice Tube: (All models) Jet size, .0276 inch (.70 mm).
(590S) Idle air bleed (in plug) size .052 inch (1.32 mm) dia.
(591S) Idle air bleed (in body) size .067 inch (1.70 mm) dia.
(592S) Idle air bleed (in body) size .063 inch (1.60 mm) dia.
(590S) Idle restriction, in body, size .0512 in. (1.30 mm) dia.
(591S) Idle restriction, in body, size .051 to .052 inch (1.30 to 1.32 mm) diameter.
(592S) Idle restriction, in body, size .048 to .050 inch (1.22 to 1.27 mm) diameter.

Idle Port: (All models) Upper port, keyhole type.
(590S) Length, .132 inch (3.35 mm). Width, .030 inch (.76 mm); .063 inch (1.60 mm) diameter hole at top. Top of port located .096 to .100 inch (2.44 to 2.54 mm) above top edge of valve.
(591S) Length, .160 inch (4.06 mm). Width, .030 inch (.76 mm); .045 inch (1.14 mm) diameter hole at top. Top of port located .118 to .122 inch (3.00 to 3.10 mm) above top edge of valve.
(592S) Length, .128 inch (3.25 mm). Width, .027 inch (.69 mm); .063 inch (1.60 mm) diameter hole at top. Top of port located .088 to .092 inch (2.24 to 2.34 mm) above top edge of valve.

Lower Port Size: (All models) .053 to .057 inch (1.35 to 1.45 mm) diameter. (For idle adjustment screw.)

Set Idle Adjustment Screw: (All models) ½ to 1½ turns open.

Main Metering Jet: (All models) Non-adjustable.
Calibrated to flow —
(590S) 148 cc. per minute.
(591S) 190 cc. per minute.
(592S) 212 cc. per minute.
(Do not gauge for size. If in doubt replace with new part.)

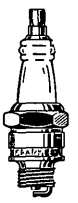
Main Metering Screw: (All models) Adjustable.

Main Vent: (All models) Through diffuser (air bleed inside bowl) size, .0315 inch (.80 mm) drill.

Main Vent Tube: (590S) 1—.0236 in. (.60 mm) drill hole in end. (Side holes) 7—.0197 inch (.50 mm) drill—one side, spaced 3/16 inch (4.76 mm) apart. First hole 9/16 inch (14.29 mm) from lower end.
7—.0197 inch (.50 mm) drill—opposite side, spaced 3/16 inch (4.76 mm) apart. First hole 21/32 inch (16.67 mm) from lower end.
(591S) (Side holes) 2—.0354 (.90 mm) drill—approx. 5/16 inch (7.94 mm) from end.
2—.0354 (.90 mm) drill—approx. 1 inch (25.40 mm) from end.
2—.0354 (.90 mm) drill—approx. 1½ in. (38.10 mm) from end.
(592S) (Side holes) 2—.0354 (.90 mm) drill—approx. 5/16 in. (7.94 mm) from end.
2—.0354 (.90 mm) drill—approx. 1 in. (25.40 mm) from end.

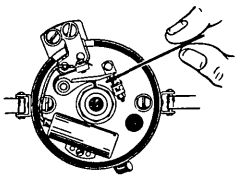
Step-Up Jet: (590S) size, .0236 inch (.60 mm) diameter.
(591S-592S) size No. 63 .037 in. (.94 mm) drill size diameter.

Accelerating Pump: (All models) Type, delayed action. Stroke, summer setting (inner hole, short stroke). Intermediate setting (center hole). Winter setting (outer hole, long stroke).
Pump intake passage, ball check seat size .115 to .120 inch (2.92 to 3.05 mm) diameter.
Pump discharge passage: Restriction (under ball check) size .062 to .065 inch (1.58 to 1.65 mm) diameter in body.
(590S) Pump (discharge) jet size: .0236 inch (.60 mm) dia.
(591S) Pump (discharge) jet size: .0315 inch (.80 mm) dia.
(592S) Pump (discharge) jet size: .0374 inch (.95 mm) dia.



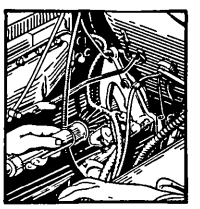
Pump Adjustment: (590S) Pump set at 23/64 inch (9.92 mm) plunger travel, with pump connector link in center or medium hole. Use Gauge No. T109-117S.
(591S) Pump set at 24/64 inch (9.53 mm) plunger travel, with pump connector link in center or medium hole. Use Gauge No. T109-117S.
(592S) Pump set at 26/64 inch (10.32 mm) plunger travel, with pump connector link in center or medium hole. Use Gauge No. T109-117S.

Choke: (All models) Butterfly type (with poppet valve), interconnected to open throttle valve to fast idle position when choke is used.



Vacuum Spark Port: (All models) Horizontal (round end) slot type, size .040 by .110 inch (1.016 by 2.794 mm). Top of port .035 to .041 inch (.89 to 1.041 mm) above top edge of valve.

Motor Tune-Up—Be Accurate! Always Use Feeler Gauges!



CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.

THESE ADJUSTMENTS MUST BE ACCURATE AND IN CONFORMITY WITH CAR MANUFACTURER'S SPECIFICATIONS

CARBURETER ADJUSTMENTS

PUMP TRAVEL ADJUSTMENT: Remove air horn assembly, back out throttle adjustment screw, and install pump operating link in center hole of throttle shaft arm. Place base of pump travel gauge (tool No. T109-117S) on upper edge of body casting at pump cylinder. With throttle valve seated turn knurled nut of gauge until projecting finger contacts top of plunger shaft. Note number indicated on gauge. Repeat with throttle valve wide open and plunger pressed to bottom of cylinder. The difference in the numbers indicated at wide open and closed throttle positions is the number of 64ths of an inch the plunger has moved. The difference in readings should be as follows: (590S)—23, (591S)—24, (592S)—26. Adjust by bending horizontal portion of pump connector link.

IDLE ADJUSTMENT: Heat engine to operating temperature and connect vacuum gauge to intake manifold. With engine idling at the specified idle R.P.M. for that particular engine on which installation is being made, turn idle adjusting screw until highest vacuum reading is obtained. Slowly open adjusting screw to point where vacuum just begins to decrease. This is known as "setting the idle on the rich side."

MAIN METERING SCREW ADJUSTMENT: There are many ways in which the main metering screw may be adjusted. Tachometers, gas exhaust analyzers and vacuum gauges are helpful but not essential in making this adjustment.

MAIN METERING SCREW ADJUSTMENT The simplest method of adjusting on the service floor is as follows

(A) Heat engine to standard operating temperature

(B) Open throttle until engine speed is approximately 30 m p h or 1,000 R P M

(C) Open main metering screw until engine operates smoothly at this speed (highest reading on tachometer or vacuum gauge) Slowly tighten main metering screw until a slight reduction in engine speed can be noticed Open screw slightly from this position until maximum speed is attained—usually not more than ⅛ to ¼ turn Hold screw steady and tighten packing nut to lock screw in position

414S—Climatic® Control

High Speed Adjustment—1¼" and 1½" Flange

Casting No. 223 on face of flange
WAI Carbureter No. 414S

For use with or without governor—Anti-percolator. Manual or vacuum operated metering rod.

CARBURETER SPECIFICATIONS

Dimensions (Both Models): Flange size, 1¼ inch and 1½ inch —special.
Primary venturi, 11/32 inch I. D.
Secondary venturi, 11/16 inch I. D.
Main venturi, 1¼ inch I. D.

Float Level (Both Models): Distance from seam of float (at free end) to tip on lower end of float chamber cover, when needle is seated, to be 5/16 inch.

Vents (Both Models): Outside, No. 10 drill. Inside, none.

Gasoline Intake (Both Models): Square vertical needle. Size No. 38 drill hole in needle seat.

Low Speed Jet Tube (Both Models): Jet size No. 68 drill.
By-pass size No. 54 drill.
Economizer size .060-.061 inch diameter.
Idle bleed size No. 52 drill.

Idle Port (Both Models): Slot type length .175 inch; width .040 inch.

Idle Port Opening (Both Models): .132 to .136 inch above valve with valve closed tight.

Idle Screw Seat (Both Models): No. 46 drill.

Set Idle Adjustment Screw (Both Models): ¾ to 1½ turns open. For richer mixture, turn screw out. Do not attempt to idle engine below 350 r. p. m.

Main Nozzle (Both Models): In primary venturi, angle 45°.
Closed tip. Inside diameter, No. 30 drill.
Upper hole: No. 75 drill on 45° angle.
Lower hole: No. 50 drill on 60° angle.

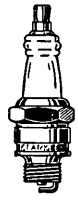
Metering Rod (Both Models): Economy step, .076 inch diameter; middle step tapers to .066 inch diameter; power step, .042 inch diameter. Length 3-9/64 inches.

Metering Rod Jet (Both Models): .091 inch diameter.

Metering Rod Setting (Both Models): Use gauge, part No. T109-102 (2.468 inches).

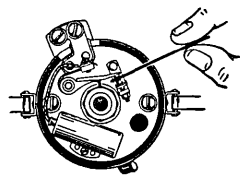
Accelerating Pump (Both Models): High pressure type (spring operated lever) with adjustable pump stroke.
Pump discharge jet size No. 71 drill.
Intake ball check seat size No. 62 drill.
Discharge ball check seat size No. 32 drill.
Relief passage to outside size No. 42 drill.

Pump Adjustment (Both Models): Pump stroke may be varied to suit condition. Loosen nut on the pump link, slide upper end of pump link away from pump shaft for greater pump stroke or toward the shaft for less stroke.



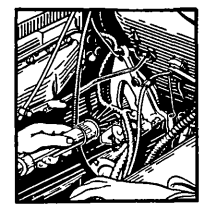
Choke: (413S) Manual—butterfly type, offset valve, inter-connected to open throttle valve to fast idle position.
(414S) Carter Climatic® Control, set at index. Butterfly type offset valve.

Choke Heat Suction Hole, in body, Size No. 38 (.1015") drill.

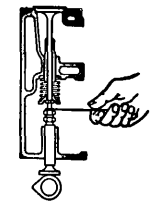


Vacuum Spark Port (Both Models): Horizontal slot type .041 x .125", bottom of slot .004" above valve (early production). Bottom of slot, .010" above valve (late production).

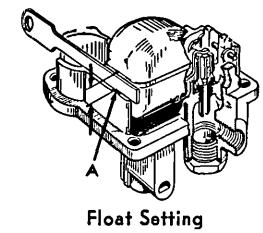
Motor Tune-Up—Be Accurate!



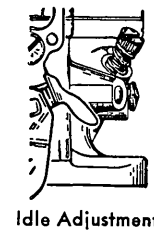
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Set Spark Plug Gap



Set Breaker Points



Adjust Ignition Timing Use Timing Light

TRADE MARK REG. U. S. PAT. FF.
MARCA REGISTRADA

PRINTED IN U.S.A.

BRIEF CARBURETER ADJUSTMENTS

PUMP ADJUSTMENT: (Both models) Should be made **BEFORE** metering rod and anti-percolator adjustments on carbureters with inspection tags marked prior to B-2; **AFTER** metering rod and anti-percolator adjustments on all carbureters with inspection tags marked B-2 or later.

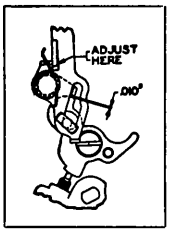
Standard setting 20/64". See "Pump Adjustment" on page 3.

METERING ROD ADJUSTMENT: (Both models) Correct setting of metering rod is important, and should be made before the pump adjustment on carbureters tagged B-2 and later; after pump adjustment on carbureters tagged prior to that marking. Procedure is as follows:

Insert gauge (tool No. T109-102) in place of metering rod, seating tapered end in metering rod jet. Hold gauge vertical to insure seating. With throttle valve seated, press down lightly on piston link directly over piston. The metering rod pin should lightly contact the shoulder of notch in gauge, but gauge should not drag on pin. Adjustment can be made as follows: On carbureters marked prior to B-2, bend lip on piston link until it contacts pump arm. On carbureters tagged B-2 and later, with pin in pump arm tightened in bottom of slot, make adjustment by bending throttle connector rod at lower angle, but **do not bend** lip "E", Fig. 1B, on link. (Use tool T109-41 for bending connector rod.)

Remove gauge, and install metering rod and disk. Then connect metering rod and spring.

ANTI-PERCOLATOR ADJUSTMENT (Both models): Crack throttle valve .030" by placing gauge T109-29 between valve and bore of carbureter (side opposite port). Bend rocker arm (use tool T109-105) until there is a clearance of .005" to .015" between rocker arm and pump arm.



FAST IDLE ADJUSTMENT: (414S) With fast idle cam held in normal idle position, tighten throttle lever adjusting screw until it just seats against cam. Hold throttle lever closed and pull cam back until first (or lower) step on cam is **against** (not on) **set screw.** There should now be 5/8" clearance between inside wall of air horn and lower edge of choke valve. (Use tool T109-85.) Adjustment can be made by bending at offset portion of fast idle link. (Use tool T109-41.)

UNLOADER ADJUSTMENT: (414S) With throttle valve wide open there should be 5/16" clearance between lower edge of choke valve and inner wall of air horn. (Use gauge T109-107.) Adjustment should be made by bending cam on throttle lever. (Use tool T109-41.)

LOCK-OUT ADJUSTMENT: (414S) With throttle and choke valves wide open, choke should lock in wide open position. Adjustment should be made by bending lip at lower end of fast idle link to give 1/32" clearance between lip and throttle lever lock with throttle and choke valves held wide open. (Use tool T109-105.)

TRIP LEVER ADJUSTMENT: (414S) After making all choke linkage adjustments, hold choke valve tightly closed with pin on fast idle cam resting at bottom of slot in fast idle link.

Adjust stop for trip lever to give .010" clearance between fast idle cam and trip lever lip. (See cut.)

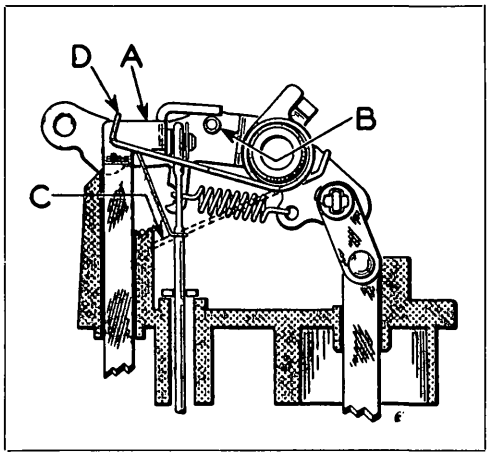


FIG. 1

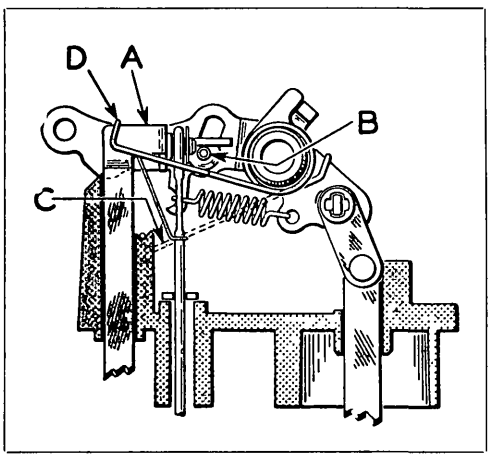

FIG. 1A

For Use Without Governor

1. The carbureter is assembled so that the piston link (A), which operates the metering rod is held in contact with a pin (B) in the pump operating lever at all times by means of a torsion spring (D).

   By unhooking the spring and allowing it to rest on small rib on side of pump link guide (Position C), the carbureter then operates as a vacumeter carbureter. First production carbureters do not have this rib, so be careful that the spring does not rest against metering rod or on metering rod disk as it may interfere with the free operation of the metering rod.

   Early production carbureters have fixed pin in pump arm (Figure 1); later production a removable pin (Figures 1A and 1B).

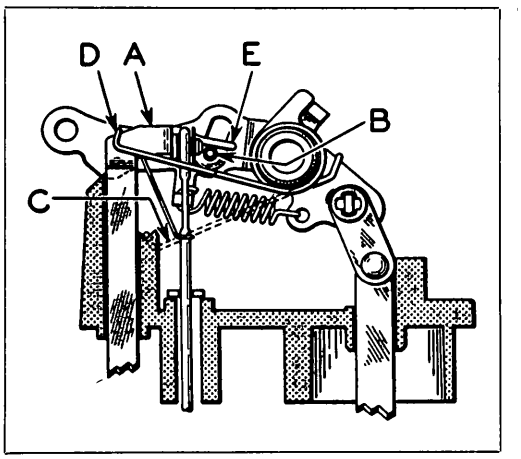

FIG. 1B

For Use With Governor

With the spring unhooked, breaking or cutting off the tongue on the piston link which contacts the pump operating lever pin (break at (A)) in early production carbureters, or removing the pin in late production carbureters, the carbureter may be used with an engine governor. The function is then the same as a vacumeter carbureter—the metering rod moves up to the power step or acceleration and returns to the economy range as the manifold vacuum builds up.

Where maximum economy is paramount, as in city bus service, the pin (B) in the pump operating lever may be used with the pin above the tongue on the piston link. This allows the vacuum, below th

governor, to draw the metering rod to the economy step but limits the movement of the metering rod to the normal mixture corresponding to the throttle position (See chart below).

	With Governor	Without Governor
Early Production (Figure 1) Non-vacumeter operat'n		Use carbureter as is
Vacumeter operation	Hook spring (D) on rib Break off tongue	Hook spring (D) on rib.
Late Production (Figures 1A & 1B) Non-vacumeter operat'n	Hook spring (D) on rib Pump arm pin above tongue	Pump arm pin below tongue Spring (D) hooked on link
Vacumeter operation	Hook spring (D) on rib Pump arm pin removed	Hook spring (D) on rib. Pump arm pin below tongue

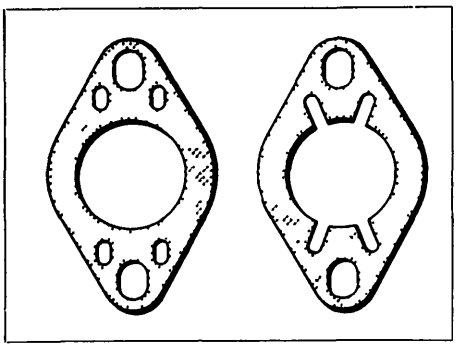

FIG. 2 FIG. 3

2.

When operating with a governor a gasket must be used as shown in Fig. 2. Otherwise the gasket as shown in Fig. 3 is used.

3.

A high speed needle is to be found in the bowl cover behind the pump lever bearing post as shown in Fig. 4. To adjust the carbureter for best economy, with the engine warmed up, speed up engine on floor, with the throttle stop screw or hand throttle, to a speed corresponding to approximately 30 miles per hour. With a small screw driver, screw high speed needle in a clockwise direction until the engine begins to lose speed. Turn screw back in anti-clockwise direction until the maximum speed is attained.

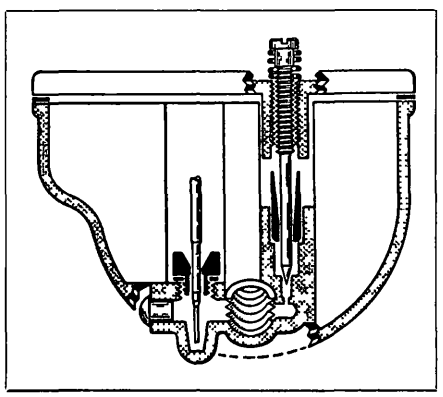

FIG. 4

4.

The groove in the carbureter flange (see D, Fig 5) connects the passage to the vacuum piston, the hole in the governor and, on the automatic choke carbureter, the passage to the choke housing.

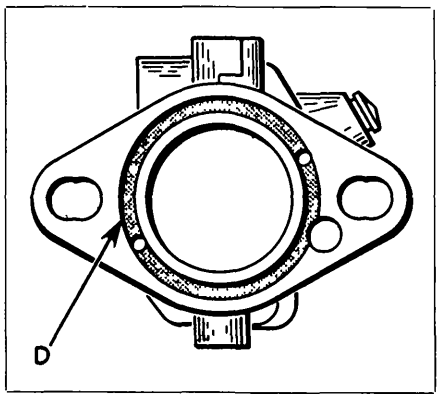

FIG. 5

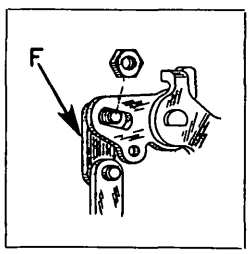
5. **Pump Adjustment:**

The pump stroke may be varied to suit, by loosening the nut on the pump link (F. Fig. 6) and sliding the upper end of the link away from the center of the pump shaft for greater pump stroke, and toward the shaft for less stroke, to suit conditions. (Standard setting is 20/64".)



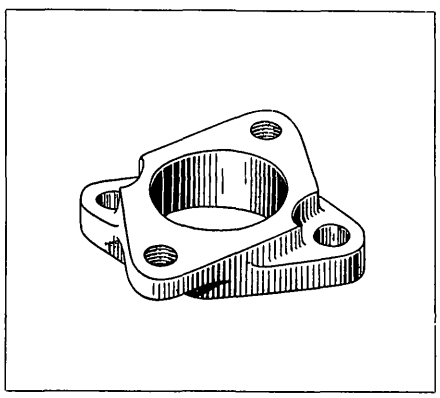


FIG. 6

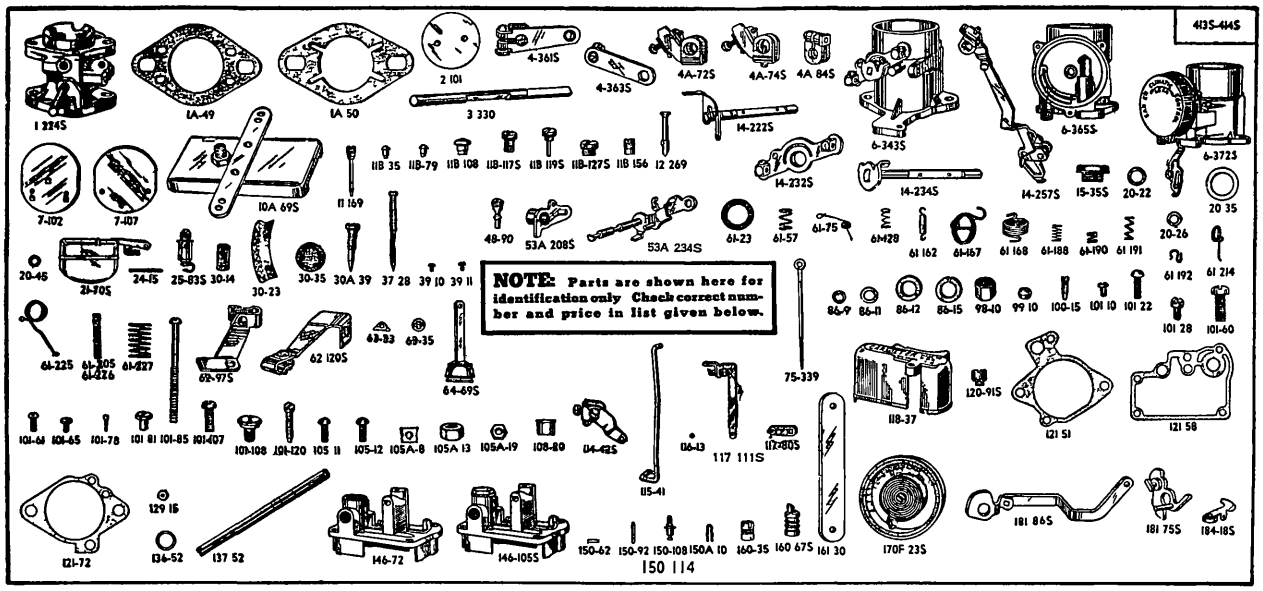

ADAPTOR FLANGES

Two adaptor flanges are available for use in making 413S or 414S installations on a number of cars. They are cross style flanges, 11/16" in height, 13/32" end holes, no thread on manifold side.

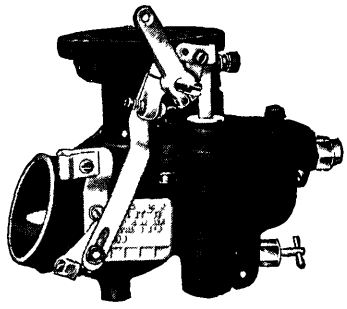
CARTER CARBURETOR BB1-BB1A-BB1D-245S-245SA-245SD-289S-289SD



DIVISION OF acf INDUSTRIES INCORPORATED
ST LOUIS, MO, U S A

December, 1934
Revised June, 1956

BB1-245S—1 inch Flange Size
BB1-Special—1¼ inch Flange Size
(BB1A or BB1D, 245SA or 245SD can be used in place of the above.)
(289SD can be used in place of 289S)

BB1-BB1A-BB1D-
245S-245SA-245SD
289S-289SD

245SA-245SD—1 inch Flange Size
BB1A-BB1D—1¼ inch Flange Size
289S-289SD—1½ inch Flange Size

THE CARBURETERS

BB1 and 245S carbureters have throttle lever riveted on shaft BB1A 245SA and 289S carbureters have throttle lever adjustable on shaft to facilitate installation where variations occur in the length of the accelerator or hand throttle rods

BB1D, 245SD and 289SD carbureters have die-cast lower body.

Early production 245SD BB1D and 289SD used float lever pin and plug assembly inserted from outside of body

Later production (starting October 1, 1945 designated as H-45 on inspection tag) uses float pin and pin retainer in slot in bowl

CARBURETER ADJUSTMENTS

High Speed Adjustment

Adjustable main metering screw controls fuel supply above idling speed Turning screw in, gives leaner mixture Turning screw out, gives richer mixture In adjusting, do not sacrifice power or performance for economy

After motor has reached normal running temperature and correct idle adjustment has been made open throttle to about 35 miles per hour engine speed Turn metering screw OUT until motor reaches maximum speed, then IN until engine speed starts to decrease Now open screw slowly until motor reaches maximum speed This adjustment will give maximum power and economy

Idle Adjustment

First, set throttle lever adjusting screw so that motor runs approximately 300 rpm Then set idle adjustment screw so that motor fires evenly (Most mechanics prefer to use a vacuum gauge setting idle adjusting screw to highest vacuum)

Note A richer mixture is obtained by backing out adjustment screw—a leaner mixture by turning screw in

The Accelerating Pump

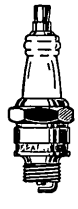
The pump operates in a well in the body casting At opening of throttle, pump discharges through main nozzle starting a flow of fuel through nozzle from main float chamber and supplying instantly the excess fuel necessary for prompt acceleration

Pump link is provided with two holes to receive pump link screw giving short and long strokes to pump piston For winter driving in Northern climates link screw should be set in outer (top) hole which gives longer stroke supplying maximum quantity of fuel for acceleration

If this does not give desired results the main metering jet check valve assembly and pump valve assembly should be removed and cleaned with compressed air

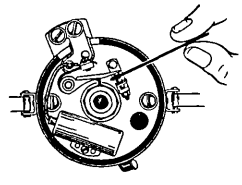
If Motor Loads—Check Float Level

To check float level remove upper casting from float chamber Remove body gasket and place gauge T109-49 across machined edges of float chamber Hold lip of float firmly against end of seated needle



Top of float (not soldered seam) should just touch float gauge

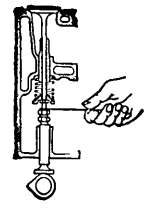
Before adjusting float see that float lever pin plug is firmly seated To lower float level bend lip of float lever toward needle To raise float level bend lip away from needle A very slight bend is usually sufficient



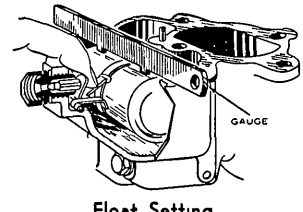
Be sure to bend lip of float not bracket holding lip against needle with needle firmly seated

Motor Tune-Up—Be Accurate!

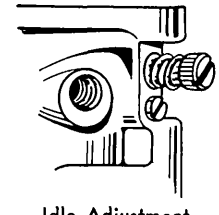
CAUTION Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Set Spark Plug Gap



Set Breaker Points



Adjust Ignition Timing Use Timing Light

Set Valves to Specification

Float Setting (Use Gauge) 1/32"-1/16" Below Top Edge of Casting

Idle Adjustment Screw Setting ¼ to 1¼ Turns Open

These adjustments must be accurate and in conformity with manufacturer's specifications.

CARBURETER SPECIFICATIONS

Dimensi ns: (BBI-BBIA-BBID-245S-245SA-245SD) Flange size, 1¼ in. (31.75 mm) (245SA and 245SD have 1¼ in. (SAE) flange but holes drilled for 1 in. manifold).

(289S-289SD) Flange size, 1½ in. (38.10 mm).

Throttle bore, 1-7/16 in. (36.51 mm).

(BBI BBIA-BBID-245S-245SA-245SD) Main venturi, 1 in. (25.40 mm) I D. Air bleed through venturi, to idle passage, .085 to .087 in. diameter (2.15 to 2.20 mm) drill.

(289S 289SD) Main venturi, 1-1/16 in. (26.99 mm) I. D. Air bleed through venturi to idle passage, .0885 to .0905 in. diameter (2 25 to 2.30 mm) drill.

Float Setting: Top of float 1/32 in. to 1/16 in. (.79 to 1.59 mm) below top surface of lower body.

Vent: (To Float Chamber) Outside, Size: No. 30 (3.26 mm) drill.

Gasoline Intake Needle: Triangular, horizontal. No. 38 (2.58 mm) drill in needle seat, 25-44S. (No. 31 (3.048 mm) drill 25-46S, used with vacuum tank or gravity feed only.)

Idle Jet Tube: Jet size, .0236 in. (.60 mm) drill.

Idle Ports: Lower port size: .062 to .064 in. (1.58 to 1.63 mm) diameter. Top of port located .005 to .009 in. (.13 to .23 mm) below lower edge of valve.

Upper port size: .053 to .057 in. (1.35 to 1.45 mm) diameter (for idle adjustment screw).

Set Idle Adjustment Screw: ¼ to 1¼ turns open. For richer mixture, turn screw out. Do not idle engine below 300 r.p.m. or 6 miles per hour.

Main Metering Screw: Adjustable.

Nozzle: No. 33 (2.87 mm) drill.

Accelerating Jets:
2—.0394 in. (1.00 mm) drill 1/16 in. (1.59 mm) from shoulder.
1—.051 in. (1.3 mm) drill ⅜ in. (9.53 mm) from shoulder.
1—.063 in. (1.6 mm) drill 23/32 in. (18.26 mm) from shoulder.
1—.051 in. (1.3 mm) drill 1-1/16 in. (26 99 mm) from shoulder.

Air Bleed to Nozzle: (BBI-BBIA-BBID-245S-245SA-245SD) Size· .0275 to .0295 in. (.70 to .75 mm) drill.

(289S-289SD) Size· .0384 to .0404 in. (1 mm) drill.

Step-up Jet: (Power Orifice) (BBI-BBIA-BBID-245S-245SA-245SD) .0315 in. (80 mm) drill.

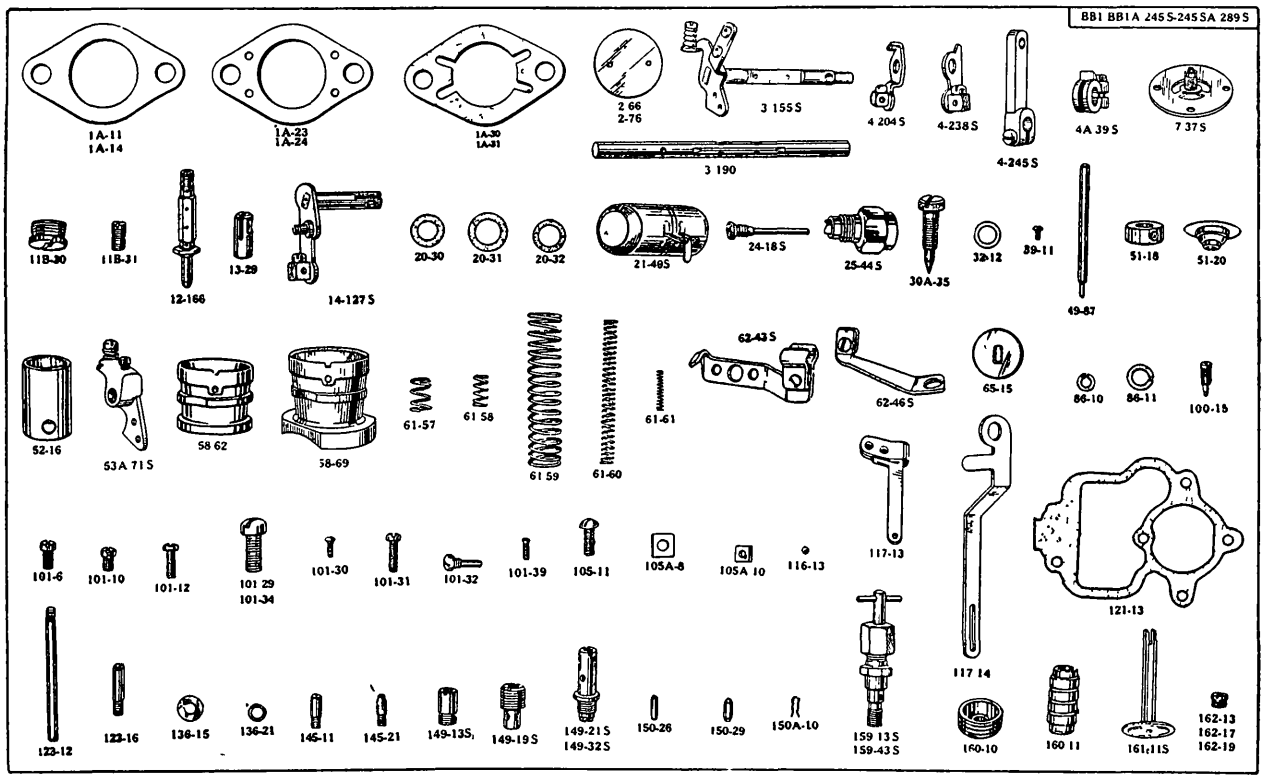
(289S-289SD) .0354 in. (.90 mm) drill.

Accelerating Pump: Type, low pressure, delayed action.

Stroke: Summer setting (inner hole, short stroke) 9/16 in. (14.29 mm).

Stroke: Winter setting (outer hole, long stroke) 1 in. (25.40 mm).

Pump intake ball check: size ⅛ in. (3.18 mm).



Pump discharge jet (in pump valve cage assembly) No. 52 (1.61 mm) drill size.

Choke: Butterfly type, with poppet valve.

Tube Clamps: On air intake and under body attaching screw.

Throttle Lever: Adjusting—on left side. Loose lever on right side.

Note: Parts shown below are for identification only. Check number and price in list given on Page 3.

162-17	†Power orifice (289S 289SD)
162-19	Power orifice (289S 289SD)

‡When servicing 289S and 289SD carbureters two nozzle gaskets No 20 30 should be installed beneath nozzle No 12 166

†This power orifice (1 mm) may be used when installations are made on motors originally equipped with 1¾ inch or larger units

★This gasket to be installed between carbureter and governor when governor is installed Original flange gasket to remain between governor and manifold

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used.

CARTER FLANGE ADAPTORS

(SIZES GIVEN ARE STANDARD S A E BOLT CENTERS)

These adaptors have been designed to make possible the installation of the Carter BB1A 245SA and 289S Carbureters on a number of cars These adaptors all have carbureter end drilled with two 13/32" holes spaced 2 11/16" center to center to fit carbureter flange Drillings of manifold ends of adaptors are shown below

Adaptor	Manifold Flange Size	Manifold End Holes	Manifold Centers
72-16	1 inch S A E.	2 holes 5/16-inch—18 thread	2⅜ inches
72-17	1½-inch S A.E	2 holes ⅜-inch—16 thread	2-15/16-inches
72-18	1 -inch S.A E	2 holes 11/32-inch No thread	2⅜ inches

72-39	1½-inch S A E	2 holes ⅜-inch—16 thread	2-15/16-inches
72-40 & 72-41	2 -inch S A E	2 holes 7/16-inch—14 thread	3-9/16-inches
72-43	1½-inch S.A E	2 holes 13/32-inch—No thread	2-15/16-inches
72-44	1½-inch S.A E.	2 holes 13/32-inch—No thread	2-15/16-inches

*Buick installations require B-19S Dash Choke Control Assembly and 92-11S Throttle Rod Assembly

★Note This flange is supplied unless otherwise specified, with special throttle lever, control rod, etc

The installations listed below have been reported as entirely successful Undoubtedly the "BB1" Carbureters will prove equally adaptable to many other motors of similar characteristics.

CARTER CARBURETOR

BB1-BB1A-BB1D-245S-245SA-245SD-289S-289SD
DIVISION OF ACF INDUSTRIES INCORPORATED
ST. LOUIS, MO., U. S. A.
December, 1934
Revised June, 1956

BB1-245S—1 inch Flange Size
BB1-Special—1¼ inch Flange Size
(BB1A or BB1D, 245SA or 245SD can be used in place of the above.)
(289SD can be used in place of 289S.)

BB1-BB1A-BB1D-
245S-245SA-245SD
289S-289SD

245SA-245SD—1 inch Flange Size
BB1A-BB1D—1¼ inch Flange Size
289S-289SD—1½ inch Flange Size

THE CARBURETERS

BB1 and 245S carbureters have throttle lever riveted on shaft. BB1A, 245SA and 289S carbureters have throttle lever adjustable on shaft to facilitate installation where variations occur in the length of the accelerator or hand throttle rods.

BB1D, 245SD and 289SD carbureters have die-cast lower body.

Early production 245SD, BB1D and 289SD used float lever pin and plug assembly inserted from outside of body.

Later production (starting October 1, 1945, designated as H-45 on inspection tag) uses float pin and pin retainer in slot in bowl.

CARBURETER ADJUSTMENTS

High Speed Adjustment

Adjustable main metering screw controls fuel supply above idling speed. Turning screw in, gives leaner mixture. Turning screw out, gives richer mixture. In adjusting, do not sacrifice power or performance for economy.

After motor has reached normal running temperature and correct idle adjustment has been made, open throttle to about 35 miles per hour engine speed. Turn metering screw OUT until motor reaches maximum speed, then IN until engine speed starts to decrease. Now open screw slowly until motor reaches maximum speed. This adjustment will give maximum power and economy.

Idle Adjustment

First, set throttle lever adjusting screw so that motor runs approximately 300 rpm. Then set idle adjustment screw so that motor fires evenly. (Most mechanics prefer to use a vacuum gauge, setting idle adjusting screw to highest vacuum.)

Note: A richer mixture is obtained by backing out adjustment screw—a leaner mixture by turning screw in.

The Accelerating Pump

The pump operates in a well in the body casting. At opening of throttle, pump discharges through main nozzle, starting a flow of fuel through nozzle from main float chamber and supplying instantly the excess fuel necessary for prompt acceleration.

Pump link is provided with two holes to receive pump link screw, giving short and long strokes to pump piston. For winter driving, in Northern climates, link screw should be set in outer (top) hole, which gives longer stroke, supplying maximum quantity of fuel for acceleration.

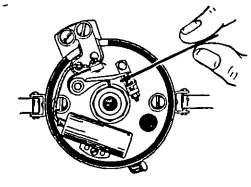
If this does not give desired results, the main metering jet, check valve assembly and pump valve assembly should be removed and cleaned with compressed air.

If Motor Loads—Check Float Level

To check float level, remove upper casting from float chamber. Remove body gasket and place gauge T109-49 across machined edges of float chamber. Hold lip of float firmly against end of seated needle.

Top of float (not soldered seam) should just touch float gauge.

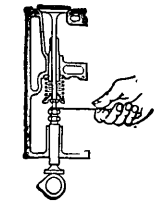
Before adjusting float, see that float lever pin plug is firmly seated. To lower float level, bend lip of float lever toward needle. To raise float level, bend lip away from needle. A very slight bend is usually sufficient.



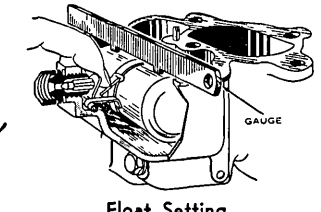
Be sure to bend lip of float, not bracket, holding lip against needle with needle firmly seated.

Motor Tune-Up—Be Accurate!

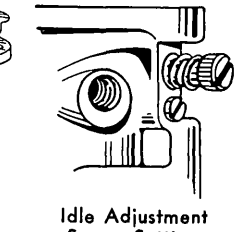
CAUTION: Change worn or leaky flange gaskets. Tighten manifold bolts and test compression before adjusting carbureter.



Set Spark Plug Gap



Set Breaker Points



Adjust Ignition Timing Use Timing Light

Set Valves to Specification

Float Setting (Use Gauge) 1/32"-1/16" Below Top Edge of Casting

Idle Adjustment Screw Setting ¼ to 1¼ Turns Open

These adjustments must be accurate and in conformity with manufacturer's specifications.

162-13	Power orifice (BB1 BB1A BB1D 245S 245SA 245SD)
162-17	†Power orifice (289S 289SD)
162-19	Power orifice (289S 289SD)

‡When servicing 289S and 289SD carbureters two nozzle gaskets No 20 30 should be installed beneath nozzle No 12 166

†This power orifice (1 mm) may be used when installations are made on motors originally equipped with 1¾ inch or larger units

★This gasket to be installed between carbureter and governor when governor is installed Original flange gasket to remain between governor and manifold

NOTE Figures in parentheses indicate number of pieces used in one carbureter Where no figure is shown, only one is used.

CARTER FLANGE ADAPTORS

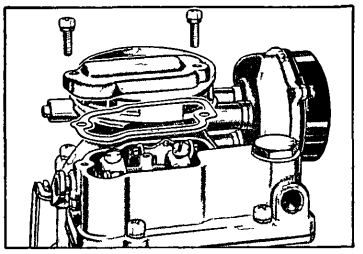
(SIZES GIVEN ARE STANDARD S. A. E. BOLT CENTERS)

These adaptors have been designed to make possible the installation of the Carter "BB1A," "245SA" and "289S" Carbureters on a number of cars. These adaptors all have carbureter end drilled with two 13/32" holes, spaced 2-11/16" center to center, to fit carbureter flange. Drillings of manifold ends of adaptors are shown below:

Adaptor	Manifold Flange Size	Manifold End Holes	Manifold Centers
72-16	1 -inch S.A.E.	2 holes 5/16-inch—18 thread	2⅜-inches
72-17	1½-inch S.A.E.	2 holes ⅜-inch—16 thread	2-15/16-inches
72-18	1 -inch S.A.E.	2 holes 11/32-inch No thread	2⅜-inches
72-19	1 -inch S.A.E.	2 holes 5/16-inch—18 thread	2⅜-inches
72-20	1¼-inch S.A.E.	2 holes ⅜-inch—16 thread	2-11/16-inches
72-21	1½-inch S.A.E.	2 holes ⅜-inch—16 thread	2-15/16-inches
72-22	1¼-inch S.A.E.	2 holes 13/32-inch—No thread	2-11/16-inches
*72-23	1½-inch S.A.E.	2 holes 13/32-inch—No thread	3⅛-inches
*72-24	1½-inch S.A.E.	2 holes 13/32-inch—No thread	3⅜-inches
72-30 & 72-31	1¾-inch S.A.E.	2 holes 7/16-inch—14 thread	3-5/16-inches
★72-32	1½-inch S.A.E.	2 holes 11/32-inch—No thread	2-15/16-inches
72-33 & 72-34	1¾ or 2-inch S.A.E.	Not drilled	
72-35 & 72-36	1¾-inch S.A.E.	2 holes 7/16-inch—14 thread	3-5/16-inches
72-39	1½-inch S.A.E.	2 holes ⅜-inch—16 thread	2-15/16-inches
72-40 & 72-41	2 -inch S.A.E.	2 holes 7/16-inch—14 thread	3-9/16-inches
72-43	1½-inch S.A.E.	2 holes 13/32-inch—No thread	2-15/16-inches
72-44	1½-inch S.A.E.	2 holes 13/32-inch—No thread	2-15/16-inches

*Buick installations require B-19S Dash Choke Control Assembly and 92-11S Throttle Rod Assembly.

★Note: This flange is supplied unless otherwise specified, with special throttle lever, control rod, etc.



The installations listed below have been reported as entirely successful. Undoubtedly the "BB1" Carbureters will prove equally adaptable to many other motors of similar characteristics.

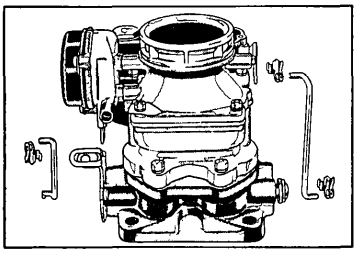
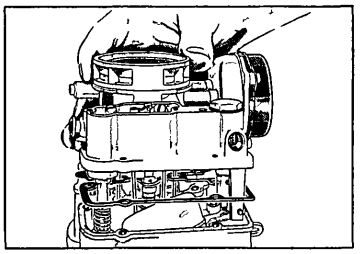
†For constant open throttle driving install power orifice No. 162-17.



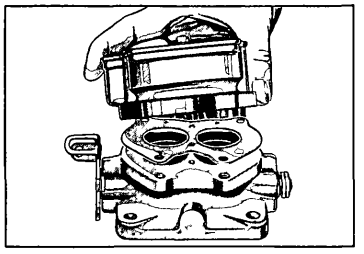
‡When installations are made on these cars install larger power orifice (step-up jet), No. 162-17.

SERVICE PROCEDURE
WGD DUAL CLIMATIC® CONTROL CARBURETER



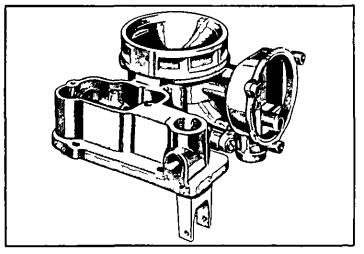
1.

Remove dust cover screws, cover and gasket.



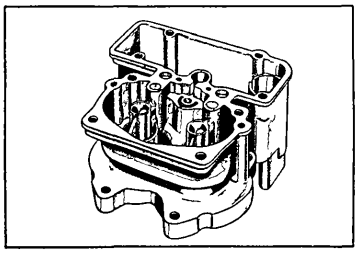
2.

Remove clevis clips, throttle connector rod and choke connector rod.



3.

Remove bowl cover with all parts attached.

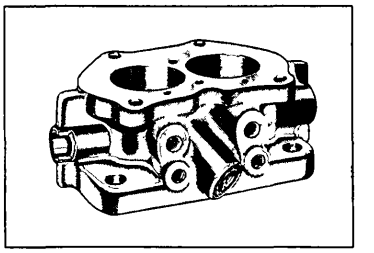


4.

Remove body flange screws, flange assembly and gasket.

5.

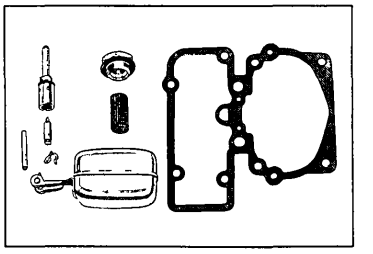
Remove all parts from bowl cover.



6.

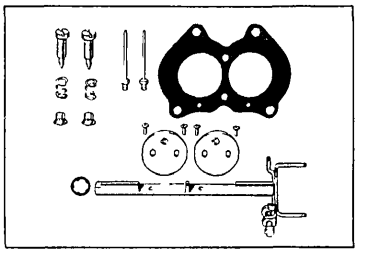
Remove all parts from carbureter body, except nozzles, and other pressed in parts.

7.



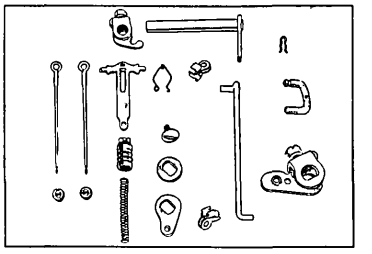
Remove all parts from body flange assembly.
*See Note

TO REASSEMBLE



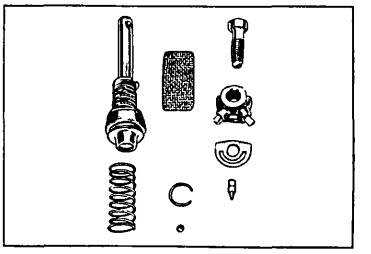
8.

Group all parts controlling gasoline level.



9.

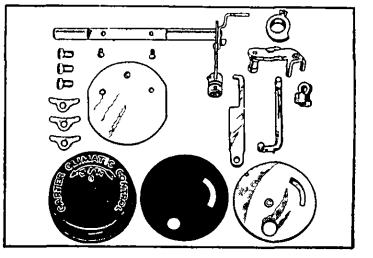
Group all parts controlling idle operation.



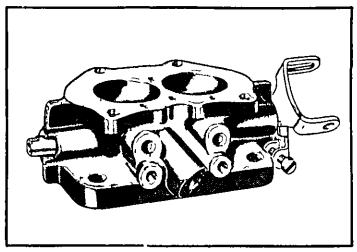
10.

Group all parts controlling high speed operation.

11.



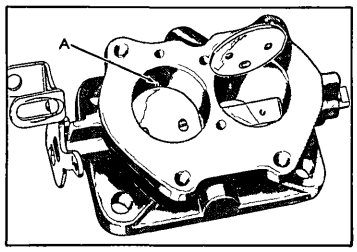
Group all parts controlling pump operation.



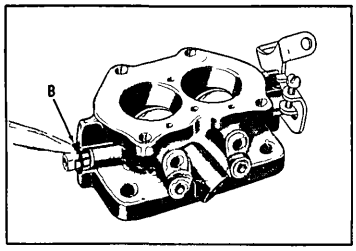
12.

Group all parts controlling choke operation.

NOTE If Welsh plug has been removed from choke housing for cleaning, install new plug.

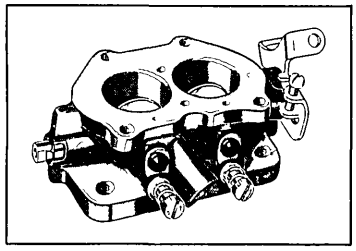


*NOTE: Wash all parts in carbureter cleaning solution, except thermostatic coil and housing assembly, starter switch parts and pump plunger **Do not soak bowl cover assembly for more than** ne-half hour.
Note carefully, slots in choke piston cylinder If they are carbonized, remove Welsh plug by piercing center with a small p inted instrument and prying outward Be careful not to damage casting Blow out passages with compressed air and scrape **carbon** from bore of flange Replace all worn or damaged parts and all gaskets



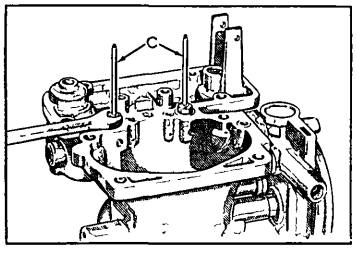
13.

Idle circuit. Install throttle shaft and lever assembly. Back out throttle lever adjusting screw.



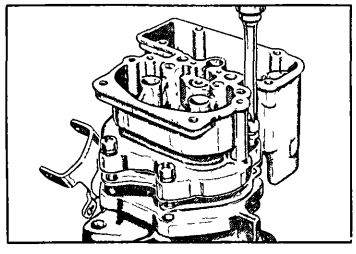
14.

Install throttle valves. Small "c" in circle should be toward idle port (A) when viewing casting from manifold side. Center throttle valves by tapping lightly and holding in place with fingers before tightening screws. Always use new screws.



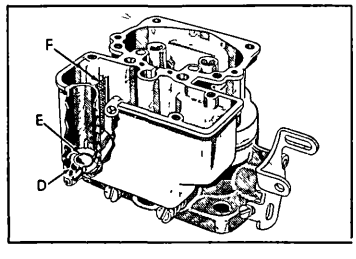
15.

Install throttle centering washer (B). With throttle closed, press shaft from lever side and install throttle centering washer with prongs extending outward. Press washer tight against casting.



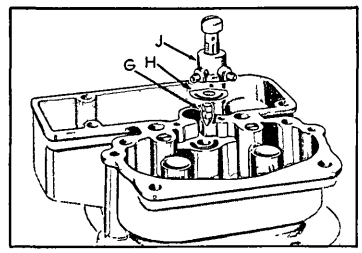
16.

Install idle port rivet plugs, then idle adjustment screws and springs. Adjust to specifications.



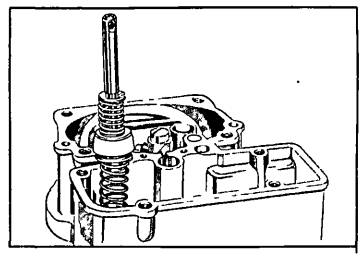
17.

Install low speed jet assemblies (C). No gaskets are used.



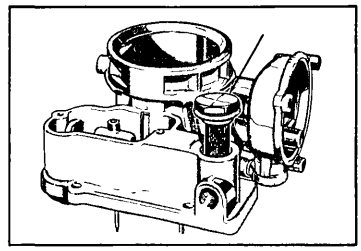
18.

Assemble body casting to flange. Use new gasket.



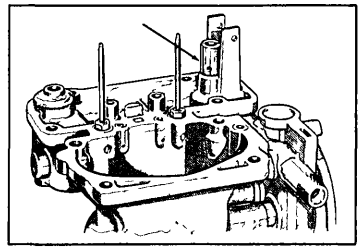
19.

Pump circuit. Install intake ball check (D), retainer ring (E) and strainer (F). Use Tool T109-122U.



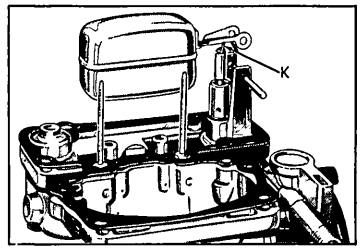
20.

Install discharge check nozzle (G) (point downward), pump jet cluster gasket (H), pump jet cluster and screw (J). Always use new gasket.



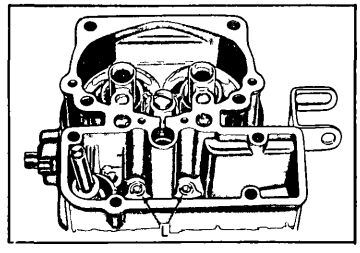
21.

Install lower pump spring and plunger assembly.



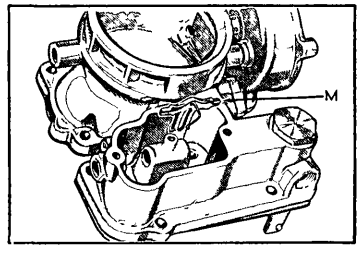
22.

Float circuit. Install bowl strainer gauze and nut and gasket assembly.



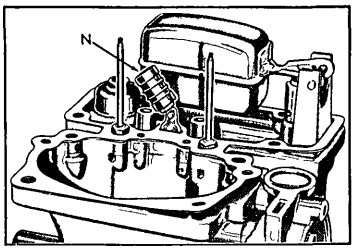
23.

Install needle seat and gasket assembly.



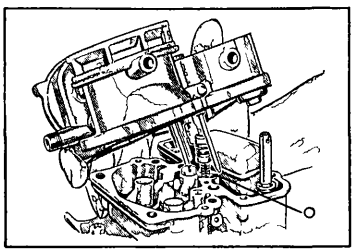
24.

Attach intake needle and pull clip (K) to float lip (when a pull clip is used), install float and lever assembly and float lever pin. Set float to specifications. Then install new bowl cover gasket.



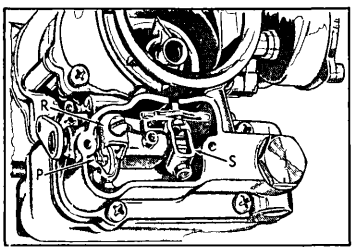
25.

Install metering rod jets (L). No gaskets are used.



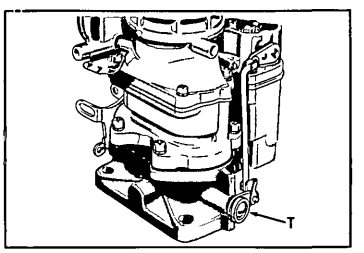
26.

Install vacumeter piston link and metering rod spring (M), lip on link extending toward air horn.



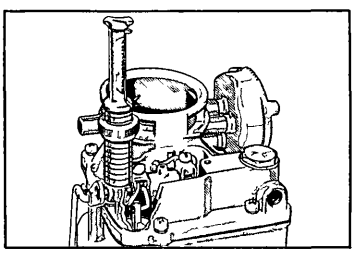
27.

Install vacumeter piston (N) on link with pin extending away from float. (See Illustration) **Install bowl cover gasket.** Always use new gasket



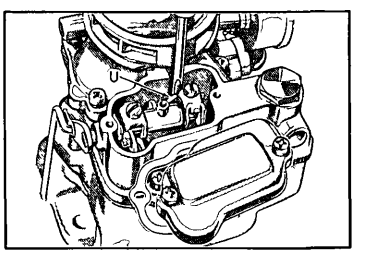
28.

Install vacumeter spring (O) in cylinder and assemble bowl cover on body. Install bowl cover screws, tightening center screws first



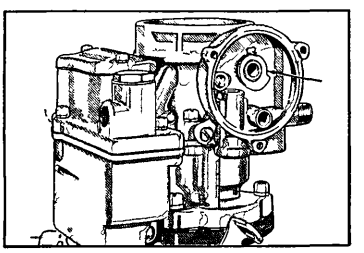
29.

Install pump connector link (P) in proper hole of pump arm. (See Specifications) **Install pin spring. Insert the lower end of connector link in hole in plunger shaft. Hold pump arm (R) in place and press shaft through arm. Hold metering rod arm (S) with lip extending through slot in vacumeter piston link and press shaft in place. Tighten pump arm screw.**



30.

Install throttle shaft lever, washer and screw (T). Install throttle connector rod and clevis clips.

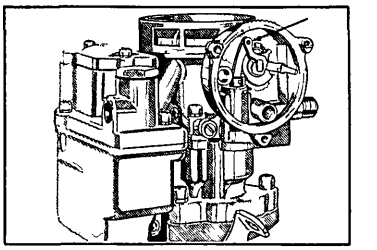


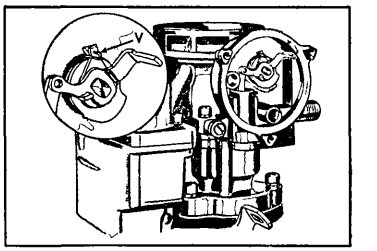
31.

Set pump.
See Specifications for instructions

32.

Install metering rods. Catch metering rod spring loop with lower end of metering rod as rods are inserted. Adjust metering rods in following manner: Back out throttle lever adjusting screw so throttle valves seat. Loosen metering rod arm set screw. Press down on vacumeter link (U) until metering rods bottom in body casting. With tongue on metering rod arm touching lip (top of slot) of link, tighten set screw, install dust cover, gasket and screws.

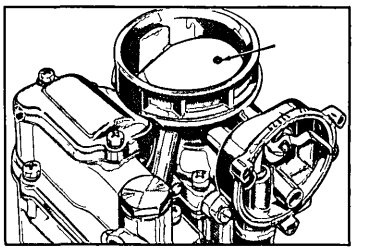




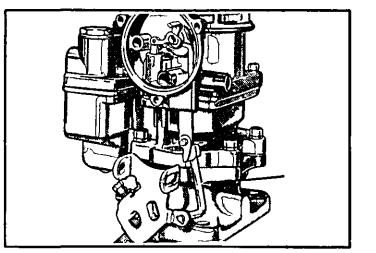
33.

Choke circuit. Install fast idle cam and spring.

34.

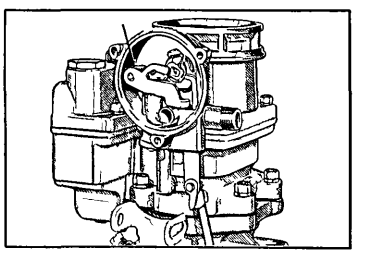


Install chok piston, l ver, link and shaft.



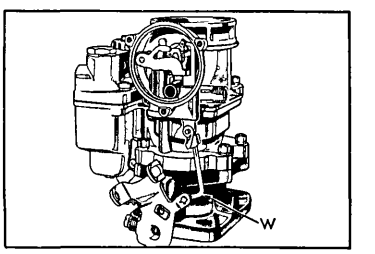
35.

Connect the fast idle cam spring (V) to the choke piston lever.



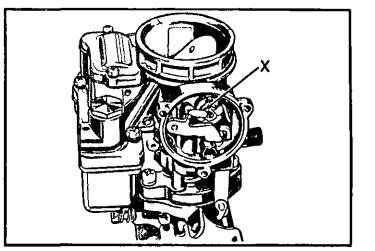
36.

Install choke valve.
Use new screws Choke valve to be installed with circle "c" visible from top of the carbureter with valve in closed position Seat choke valve by tapping lightly, hold in place with finger before tightening screws Valve or shaft must not bind in any position



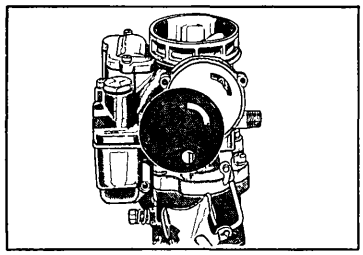
37.

Install fast idle link, choke connector rod and clevis clip.



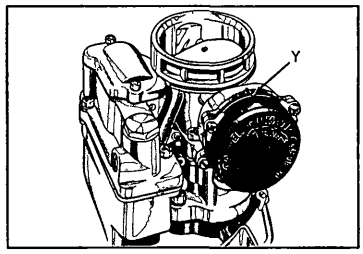
38.

Install choke trip lever assembly.



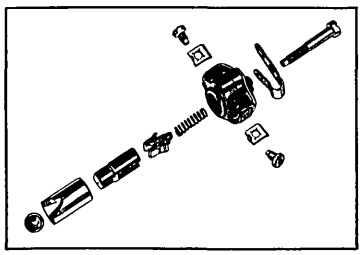
39.

Fast idle adjustment.
With choke valve tightly closed, adjust by bending choke connector rod at lower angle (W) to give clearance (see specifications) between the throttle valve and bore of carbureter (side opposite port) Use bending Tool T109 41



40.

Unloader adjustment.
With throttle valves wide open, bend lip (X) on choke trip lever to get clearance (see specifications) between top edge of choke valve and inner wall of air horn Use bending Tool T109 187

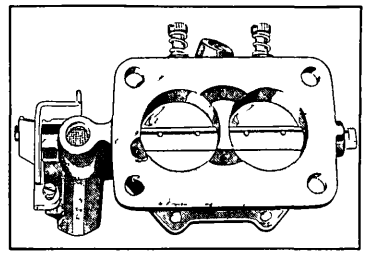


41.

Install ch k baffle plat and gasket.

42.

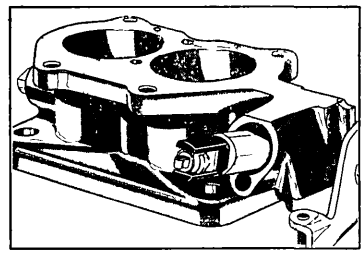
Install thermostatic coil and housing assembly, retainers and screws.
Install housing with index marks to bottom Revolve housing in direction opposite to that of arrow, set index marks (Y) to specifications Tighten attaching screws.



STARTER SWITCH (Where Used)

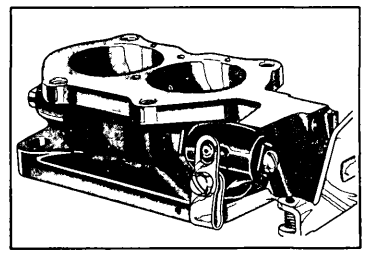
43.

Group all parts for starter switch.



44.

Install switch strainer.

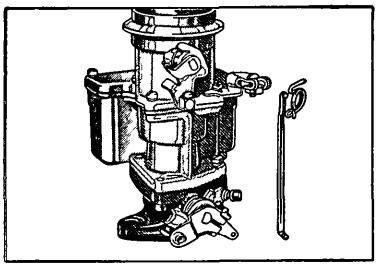


45.

Install switch ball, switch plunger (notch up), guide block and "W" shaped switch contact spring.
Reinstall original shims under contact spring.

46.

Install switch return spring, terminal cap assembly, hold down clip and attaching screw. Set switch to specifications.



Not : The specifications referred to in this procedure are detailed in catalog pages issued for each Carter carbureter. These pages can be obtained from Carter Carburetor Corporation, Catalog Department, St. Louis (7), Missouri. Please specify the carbureter number found on the brass identification tag, when requesting specifications.

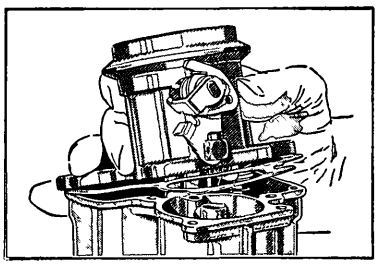
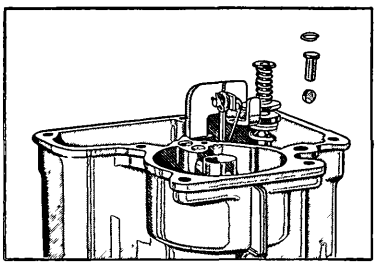
CARTER CARBURETOR
DIVISION OF acf INDUSTRIES INCORPORATED
ST. LOUIS, MO., U. S. A.

SERVICE PROCEDURE
YF DOWNDRAFT CARBURETER



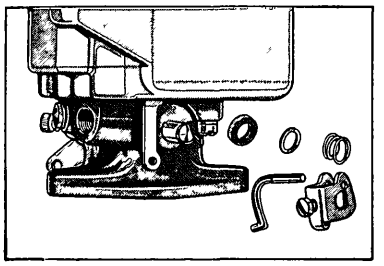
1.

Remove pin springs, fast idle connector rod spring and rod.



2.

Remove air horn and bowl cover attaching screws (7), and choke tube clamp assembly.

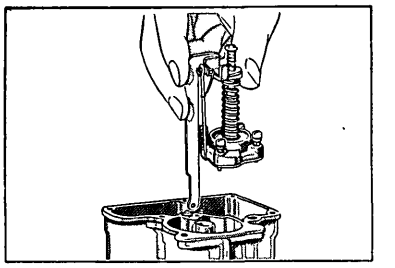


3.

Remove air horn assembly and gasket.

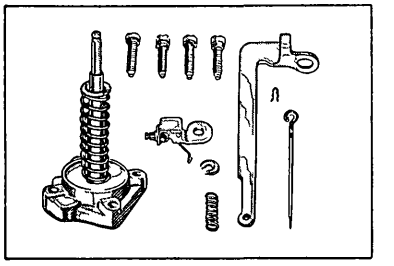
4.

Remove pump disc retainer ring (using knife tip) retainer and pump check disc.



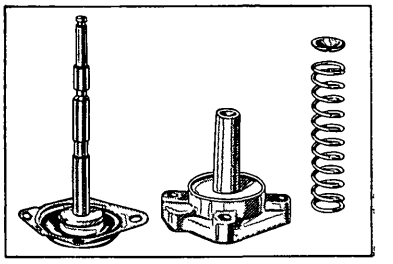
5.

Remove throttle shaft arm assembly, pump connector link, shaft seal spring, dust seal washer and felt dust seal.



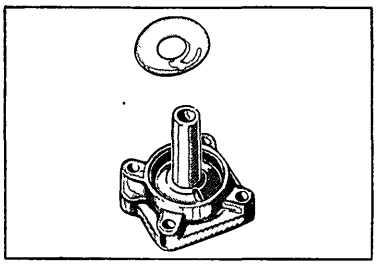
6.

Loosen diaphragm housing attaching screws (4) and lift out entire pump and metering rod assembly.



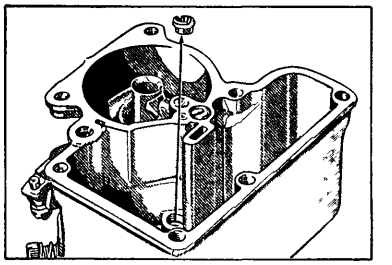
7.

Remove diaphragm housing attaching screws, pin spring, metering rod, upper pump spring retainer, upper pump spring, metering rod arm assembly and pump lifter link.



8.

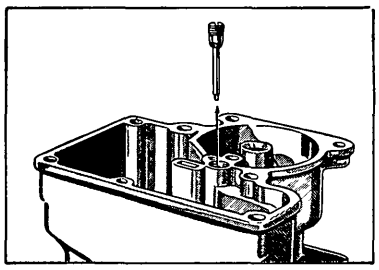
Remove diaphragm spring retainer, spring and pump diaphragm assembly.



9.

Carefully remove pump intake strainer from housing, using tip of knife blade.

10.



Remove metering rod jet.

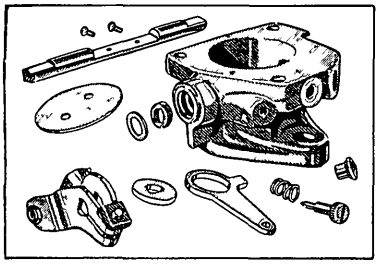
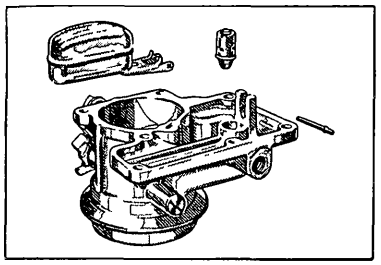
CARBURETER
TRADE MARK REG U. S PAT. OFF.
MARCA REGISTRADA

PRINTED IN U.S.A.



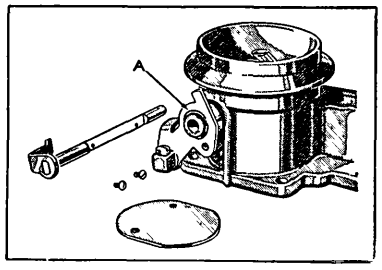
11.

Remove low speed jet assembly. **Do not remove pressed in parts such as: nozzle, pump jet or anti-percolator air bleed.**



12.

Remove body flange attaching screws (3), body flange assembly and gasket.



13.

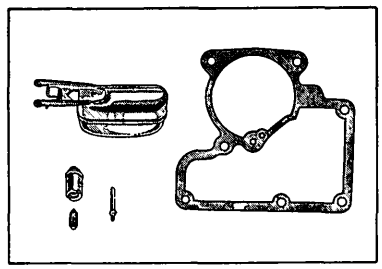
Remove idle adjustment screw, spring, idle port rivet plug, throttle lever assembly, washer, fast idle arm, valve attaching screws (2) and throttle shaft. Then remove throttle shaft seal by prying out seal retainer. **Do not remove vacuum passage orifice (pressed in).**

14.

Remove float pin, float, and needle and seat assembly from air horn casting

15.

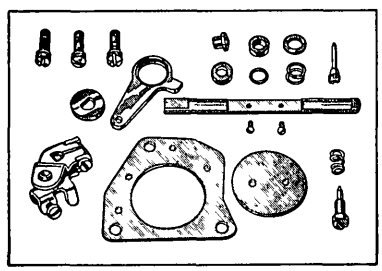
Remove choke valve screws and choke valve. Unhook choke spring and slide shaft from housing. **Do not remove balance vent tube.** Note: In normal service, choke lever assembly will not require replacing. However, if it has been bent or otherwise damaged requiring replacement, proceed as follows: Pry off choke lever retainer ring (A) and remove lever assembly



16.

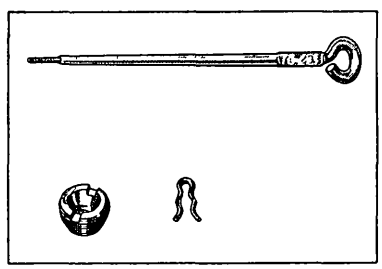
Wash all parts in carbureter cleaning solution and blow out passages with compressed air. **Do not immerse diaphragm assembly, pump check disc or seals in cleaning solution.** Inspect all parts for wear or damage—replace if necessary. Always use new gaskets.

TO REASSEMBLE



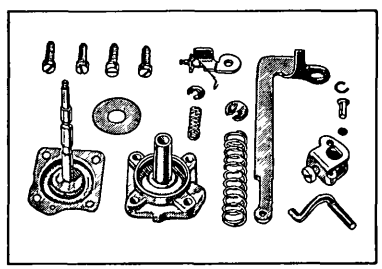
17.

Group all parts controlling float circuit: float, float pin, needle and seat assembly, air horn gasket.



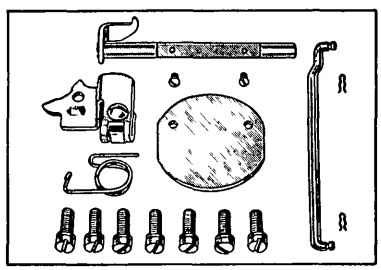
18.

Group all parts controlling low speed circuit: Throttle shaft seals (2) and retainers (2), throttle shaft, throttle valve and screws, fast idle arm, throttle shaft washer, throttle lever assembly, idle port rivet plug, idle adjusting screw and spring, gasket, attaching screws (3), low speed jet, throttle shaft seal spring

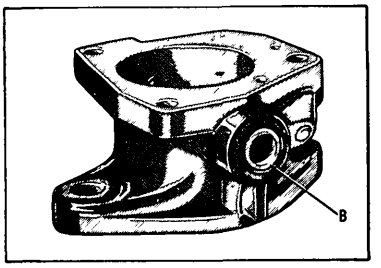


19.

Group all parts controlling high speed circuit: Metering rod, metering rod jet, pin spring.

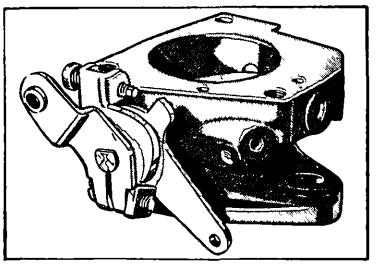


20.

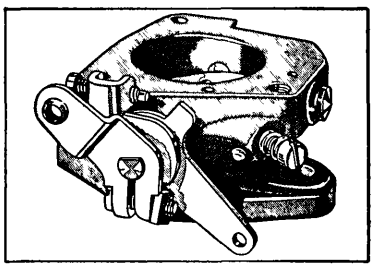


Group all parts controlling pump circuit: Pump lifter link, pump connector link, throttle shaft arm assembly, metering rod arm assembly, pump diaphragm housing, pump diaphragm assembly, pump diaphragm spring, diaphragm spring retainer, pump intake strainer, upper pump spring, upper pump spring retainer, pump disc check, pump disc retainer, pump disc retainer ring, diaphragm screw and washer assemblies (4).

21.

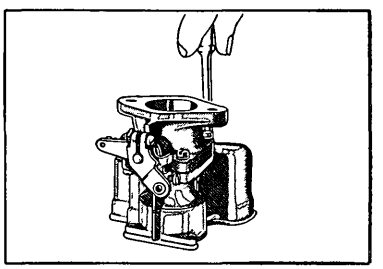


Group all parts controlling choke circuit: Choke valve and screws (2), choke shaft and lever assembly, fast idle connector rod and spring, choke tube clamp assembly, air horn attaching screw and washer assembly (7), pin spring (2).



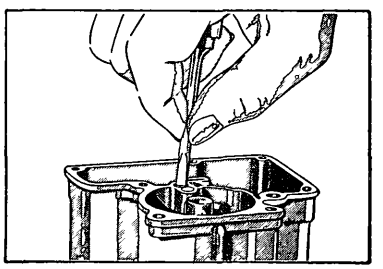
22.

Install throttle shaft seal and retainer (B) in flange casting.



23.

Install fast idle arm, washer and lever assembly on throttle shaft, slide shaft into place and install throttle valve. Carter trademark (c) should go toward the idle port when viewed from manifold side of flange. Tap valve and hold in place with finger before tightening screws.

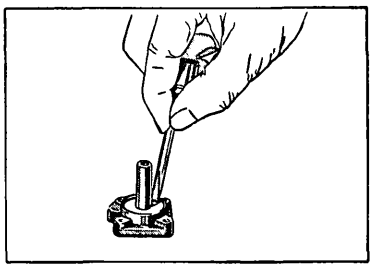


24.

Install idle port rivet plug and idle adjusting screw and spring.

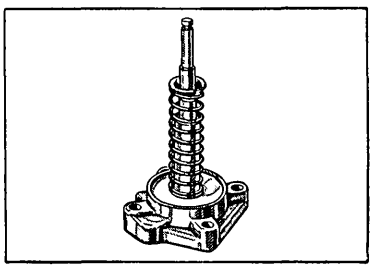
25.

Attach flange assembly to body casting Use new gasket



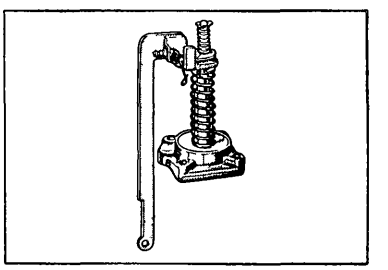
26.

Install low speed jet assembly.



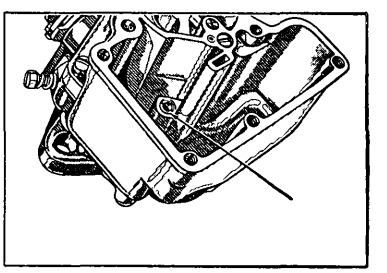
27.

Install pump intake strainer in pump diaphragm housing and carefully press into recess. Caution: If strainer is even slightly damaged, a new one must be used



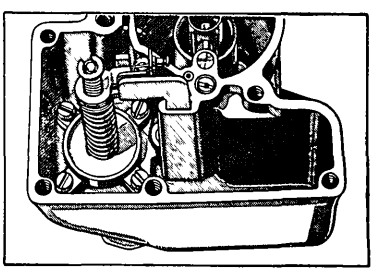
28.

Install pump diaphragm assembly in diaphragm housing, then install pump diaphragm spring (lower) and retainer.

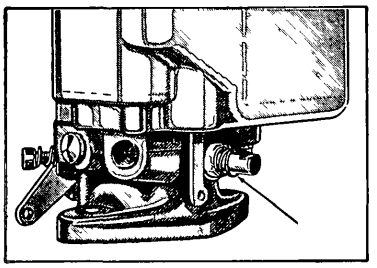


29.

Install pump lifter link, metering rod arm, upper pump spring and retainer

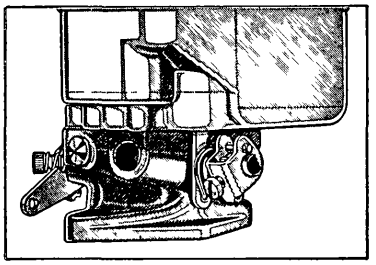


30.

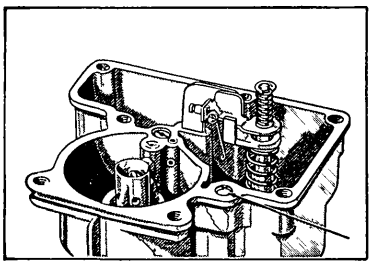


Install metering rod jet. (No gasket used with this jet.)

31.

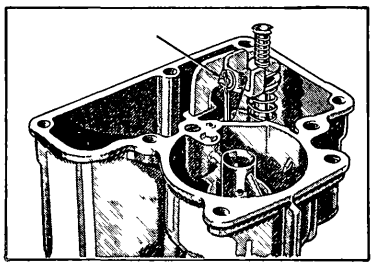


Install diaphragm housing attaching screws (4) in the diaphragm housing, making sure the edges of diaphragm are not wrinkled. Lower into place and tighten screws evenly and securely.



32.

Install throttle shaft seal, dust seal washer, and shaft seal spring.

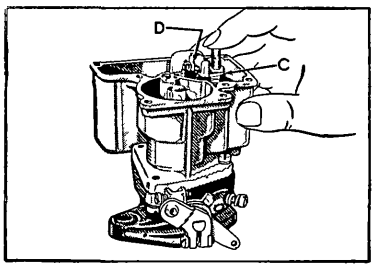


33.

Install pump connector link in the throttle shaft arm assembly. Install throttle shaft arm assembly on throttle shaft, guiding connector link into pump lifter link hole. Caution: Linkage must not bind in any throttle position. If binding occurs, loosen clamp screw in throttle arm, adjust slightly and retighten screw.

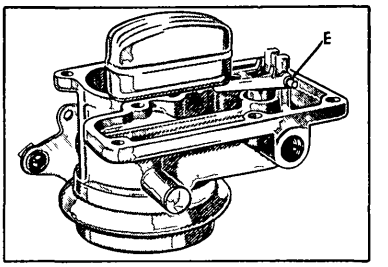
34.

Install pump check disc, disc retainer, and lock ring.



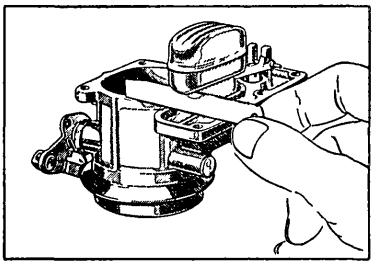
35.

Install metering rod and pin spring. Connect metering rod spring.



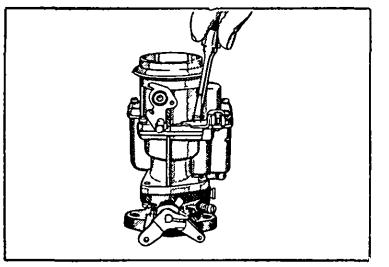
36.

Metering Rod Adjustment: Be sure flat of metering rod arm is parallel to flat of pump lifter link before proceeding with metering rod adjustment. With throttle valve seated, press down on upper end of diaphragm shaft. Metering rod should be seated in casting and metering rod arm flat against pump lifter link (C). If metering rod does not seat in body casting (check by pressing downward on metering rod) or seats before the metering rod arm makes flat contact with pump lifter link, raise or lower by bending lip (D) on metering rod arm.



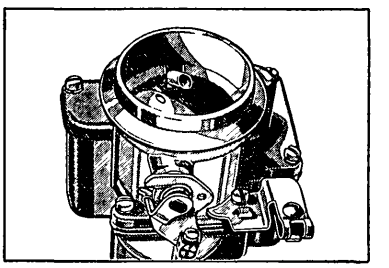
37.

Install needle seat and gasket assembly, needle, float and float pin. **Stop shoulder (E) on float pin must be on side away from bore of carbureter.**



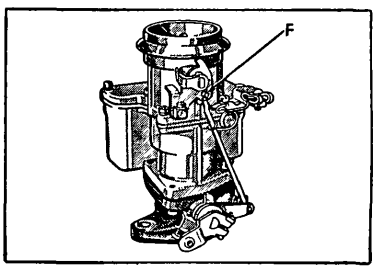
38.

Set float level to catalog page specifications. Measure from machined surface of casting (gasket removed). Adjust by bending lip which contacts needle.



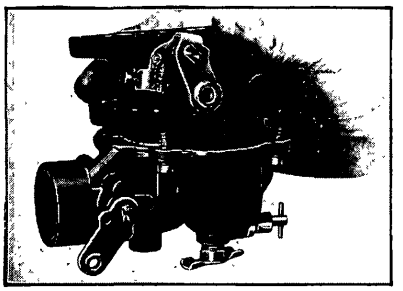
39.

Install air horn gasket and air horn assembly. Install attaching screws and lock washers (7) and choke tube clamp assembly. (Tighten center screws first.)



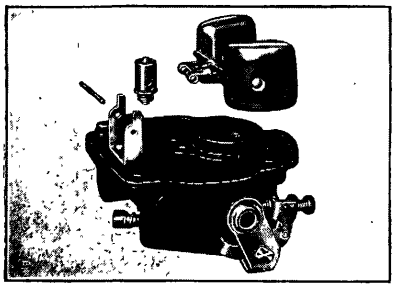
40.

Slide choke shaft and lever assembly into place and connect choke lever spring. Install choke valve. Center valves by tapping lightly and hold in place with fingers when tightening screws

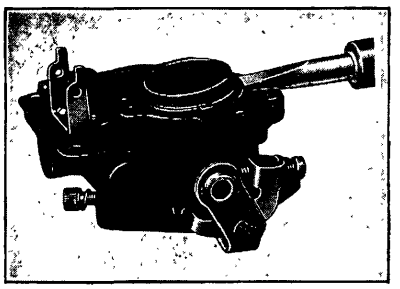


41.

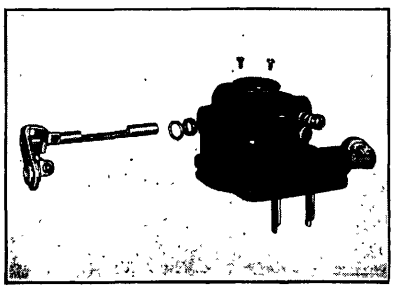
Install fast idle connector rod with offset portion of the rod to top and pin spring to the outside (F). Install fast idle connecting rod spring.



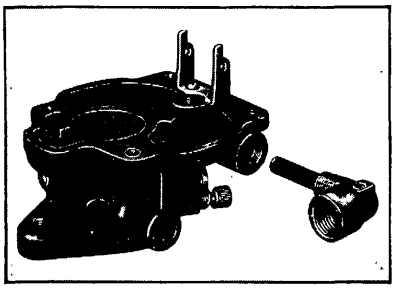
SERVICE PROCEDURE
UT UPDRAFT CARBURETER



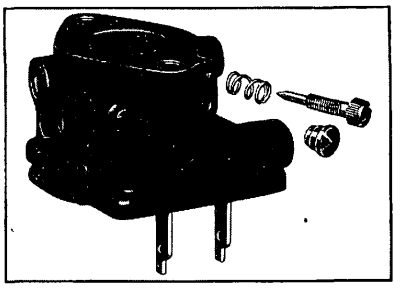
A fast, simple, Circuit method of servicing. Use Carter tool kit. BE ACCURATE.



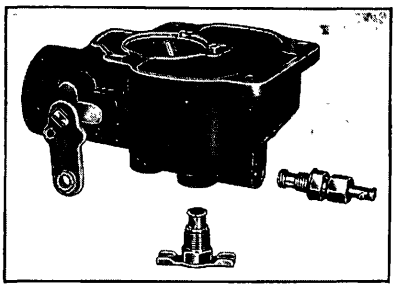
1. Remove flange attaching screws and washers (4) and lift off bowl cover assembly.



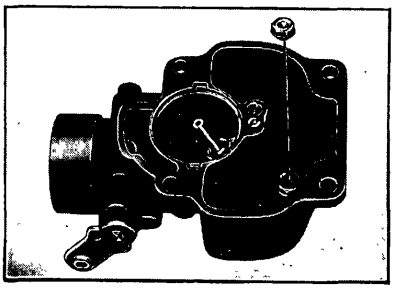
2. Remove float pin, float, and needle and seat assembly. Use tool T109-61 or screw driver wide enough to reach across needle seat slots.



3. Remove venturi and bowl cover gasket. Venturi seals at top edge with light press fit; to loosen, pry venturi upward with screw driver from bowl vent recess. Tap lightly on opposite side if necessary.



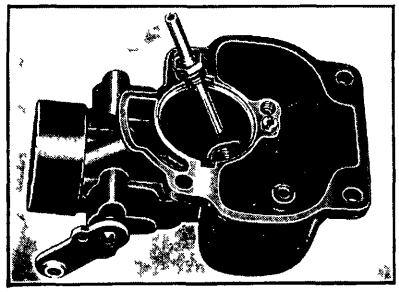
4. Remove throttle valve screws, valve, and shaft and lever assembly. Pry out throttle shaft seal retainer and remove seal.



5. Remove fuel line elbow and strainer assembly.

6. Remove idle adjustment screw and spring, then remove idle port rivet plug. (Use tool T109-43).

7. Remove bowl drain cock (found only on some models) and main metering jet assembly.



8. Fixed type main metering jet is shown in this picture.

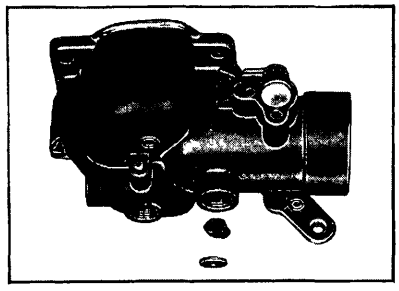
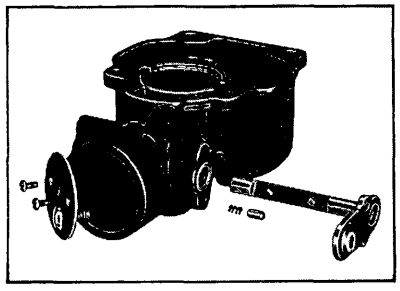
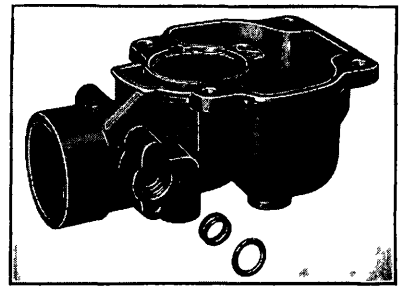
CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA



PRINTED IN U.S.A.

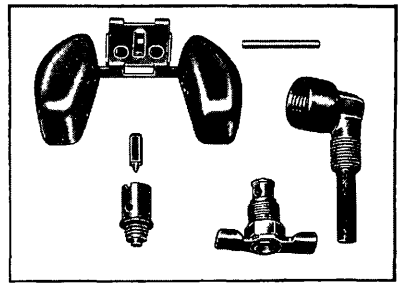


9 Remove nozzle and gasket assembly (Use Tool T109 203)

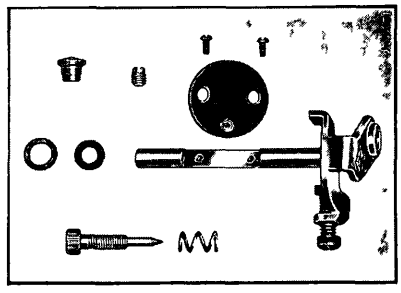


10. Remove nozzle bleed and idle jet

11. Remove dust seal retainer and felt packing from air horn Pry out with small point

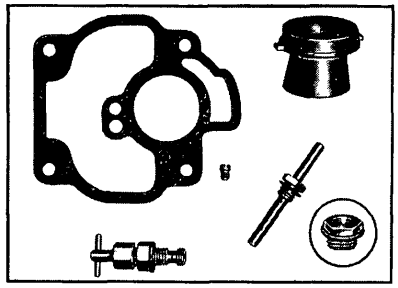


12 Remove choke valve screws choke valve choke shaft and lever assembly choke lock pin and spring Note when removing the choke shaft and lever assembly be careful not to lose the choke lock pin and spring

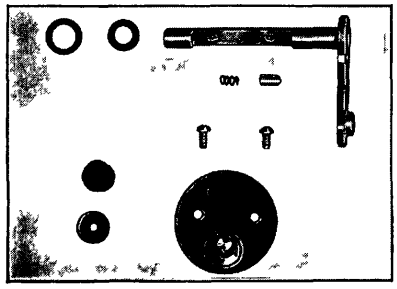


13. Pry out shaft seal retainer and remove seal. **Do not remove expansion plugs from ends of throttle shaft and choke shaft when present.**

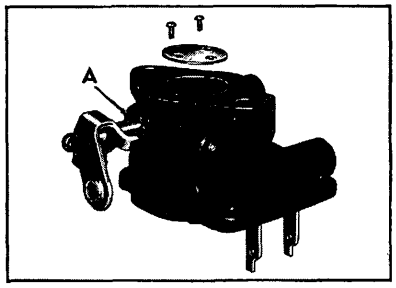
14 Wash all parts (except dust seals) in carbureter cleaning solution and rinse Blow out all passages with compressed air replace any worn or damaged parts. **Always use new gaskets.**



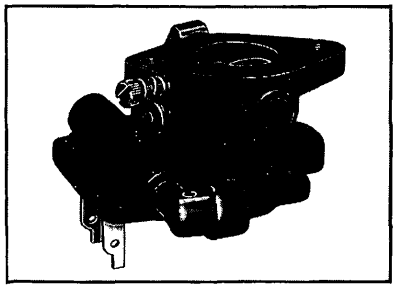
TO REASSEMBLE



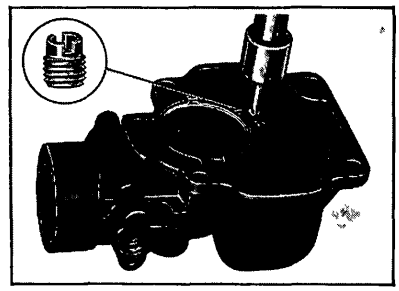
15. Group all parts controlling fuel level (float circuit)· Float, float pin, needle and seat assembly elbow and strainer assembly bowl drain cock (if used)



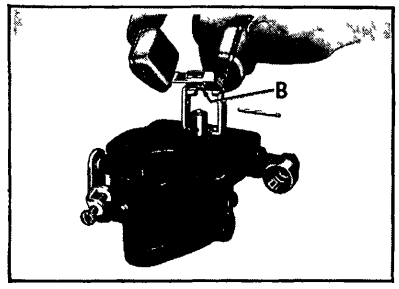
16 Group all parts controlling low speed circuit Throttle shaft and lever assembly dust seal dust seal retainer throttle valve and screws idle adjustment screw and spring idle jet screw plug idle port rivet plug



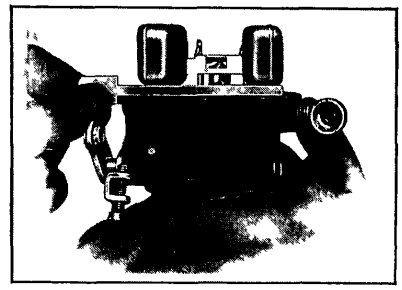
17. Group all parts controlling high speed circuit Nozzle and gasket assembly venturi nozzle bleed, bowl cover gasket main metering jet assembly or high speed adjusting needle if used



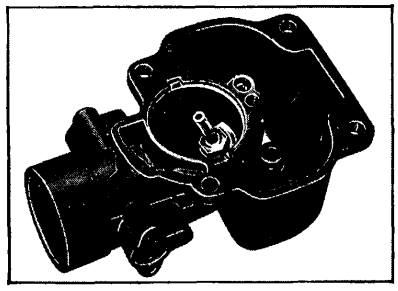
18. Group all parts controlling choke circuit Choke shaft and lever assembly dust seal dust seal retainer, choke valve assembly, valve screws, choke lock pin and spring, air horn drain felt and retainer



19. Install dust seal (with groove to outside) and retainer (throttle shaft) A Install throttle shaft and lever assembly *Install throttle valve with C towards the idle port when viewed from flange side Center valve in bore before tightening screws Caution Be sure throttle lever adjusting screw is backed out from boss on casting

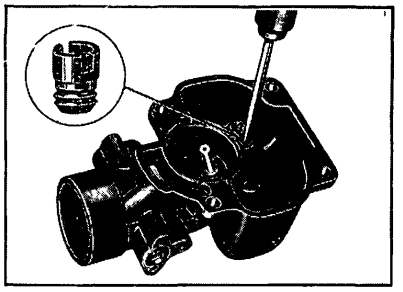


20 Install idle port rivet plug, idle adjustment screw and spring and elbow and strainer assembly

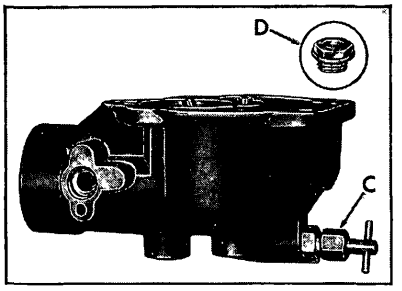


21. Install idle jet Note Idle jet has larger thread than nozzle bleed screw plug Do not interchange parts

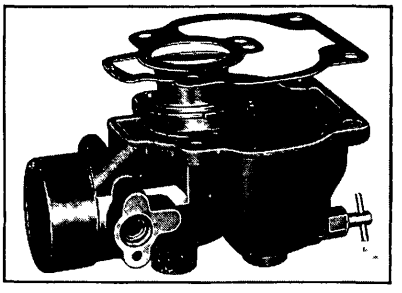
22 Install needle and seat assembly (use tool T109 61, or screw driver wide enough to reach across slots) float and float pin **with lip "B" of float lever against needl .**



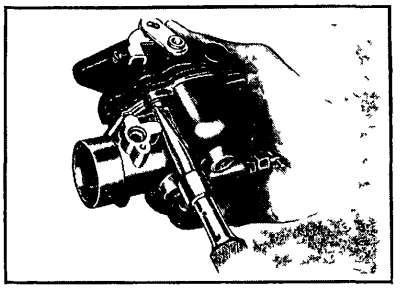
23. Set float to specifications as indicated on catalog page Measure distance between machined surface of casting and float



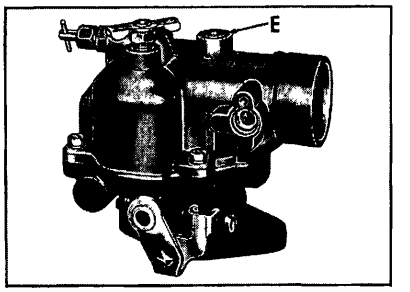
24 Install nozzle and gasket assembly.



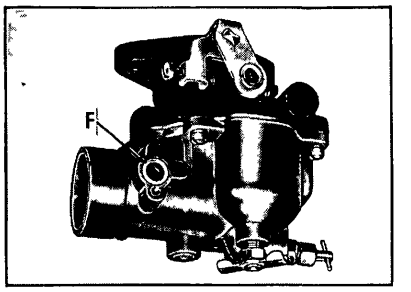
*NOTE First production carbureters stamped G 49 and H 49 may be found with the 'C located on the opposite side from the idle port. In this instance valves so stamped should be installed with the "C' opposite the idle port



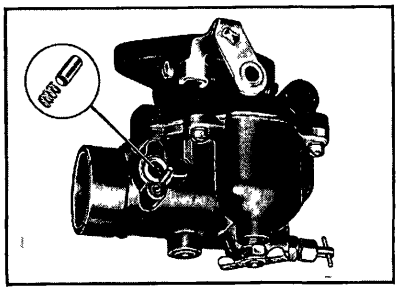
25. Install nozzle bleed



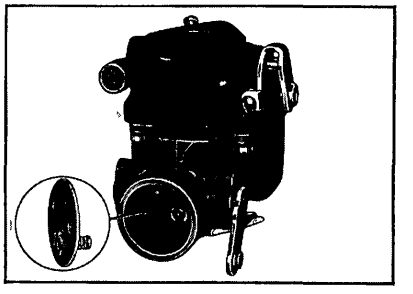
26. Install main metering jet assembly (adjustable "C" or fixed type "D").



27. Install venturi in body casting, then install bowl cover gasket.



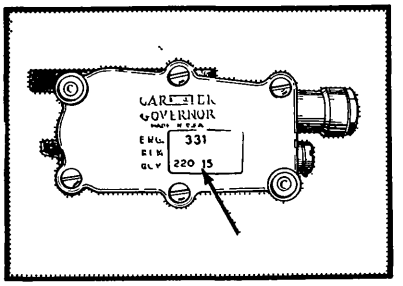
28. Install bowl cover as assembled Install four bowl cover attaching screws. Tighten evenly and securely (Retighten after carbureter has been in service).



29. Install drain cock (where used), air horn drain felt and retainer "E". If necessary, carefully stake casting around dust seal retainer.

30. Install dust seal (with groove to outside) and retainer "F" (choke shaft). Press retainer to shoulder in casting and carefully stake casting around dust seal.

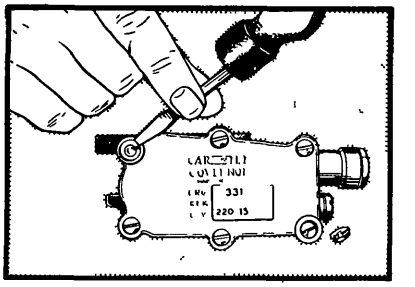
31. Install choke lock spring and pin. Be sure flat end of pin is against spring.



32. Install choke shaft and lever assembly. Install choke valve assembly with poppet valve stem towards the bowl Install choke valve screws. (Center choke valve before tightening screws)

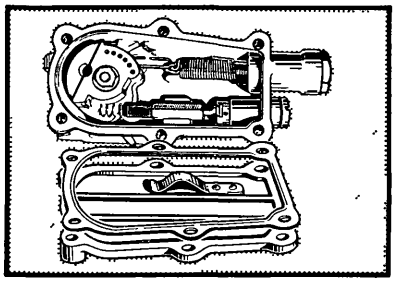
33. Set throttle lever adjusting screw to open throttle slightly. Adjust idle adjustment screw and high speed adjusting needle (when used). See catalog page for correct specifications. **Note:** Final adjustments must be made with carbureter operating on engine.

SERVICE PROCEDURE



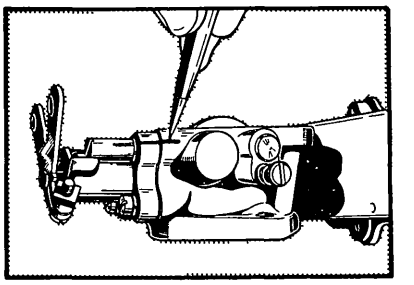
CARTER VELOCITY GOVERNOR

To be used in conjunction with governor instruction sheet.



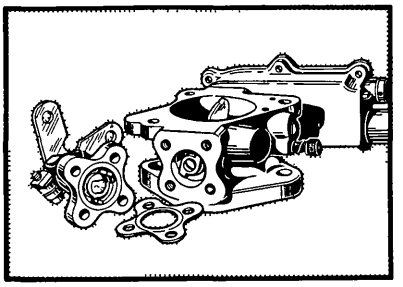
1.

Determine the governor unit number. (Stamped on governor cover plate and also on housing on later production)



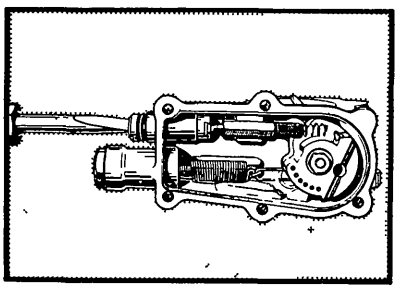
2.

Remove lead seals from cover plate



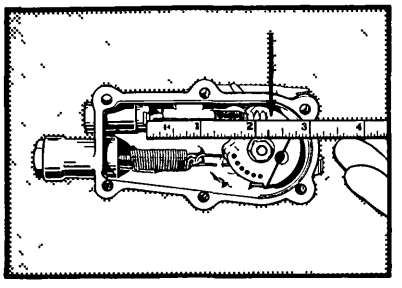
3.

Remove cover plate assembly and gasket



4.

Mark location of throttle stop screw so re-assembly will be correct

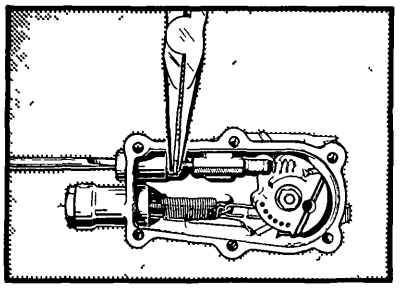


5.

Remove shaft housing and lever assembly and gasket.
CAUTION: Do not submerge these parts in cleaning solvent. To clean bearings in throttle casting squirt with non-corrosive solvent and dry with compressed air. Do not lubricate

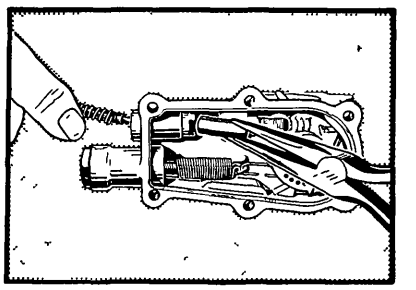
6.

Remove secondary screw plug and gasket assembly.



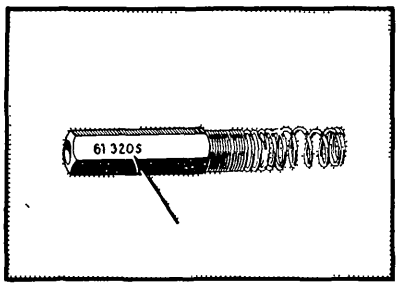
7.

Check "A" dimension.



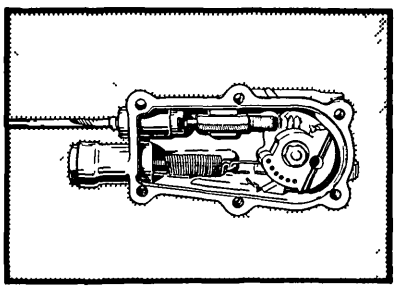
PRINTED IN U.S.A.

Copyright 1948
by Carter Carburetor Corporation
All rights reserved.



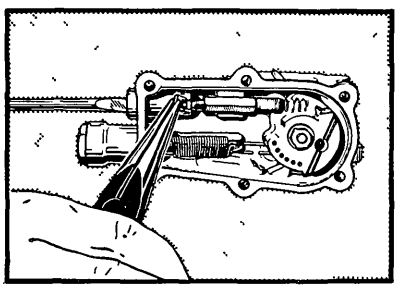
8.

Press secondary adjusting screw in with screw driver and remove retainer



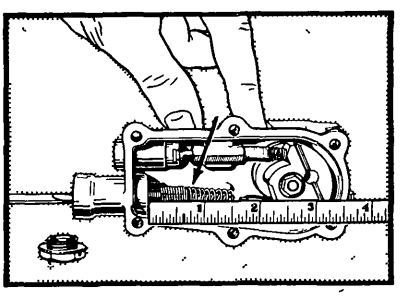
9.

Remove secondary adjusting screw, friction spring and secondary spring assembly.



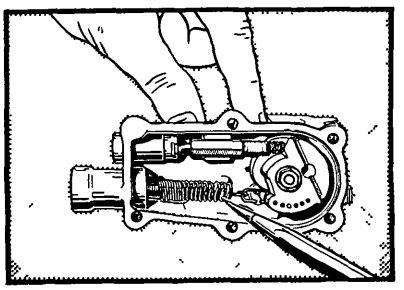
10.

Identify secondary spring assembly and re place with new part (Number stamped on spring holder)



11.

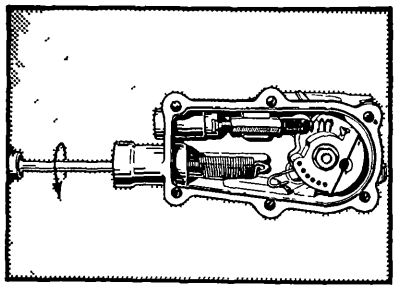
Install friction spring and secondary adjust ing screw



12.

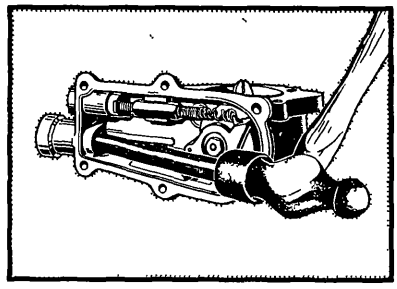
Install secondary spring retainer.
CAUTION. Be sure retainer is installed in the proper slot and not against the threads. Adjust secondary screw until "A" dimension is set to specifications If spring buckles with throttle in closed position, remove secondary spring assembly and revolve entire spring assembly 1/6 turn and reinstall. If necessary, repeat until buckling condition no longer exists.
Do not remove spring from its holder.

13.



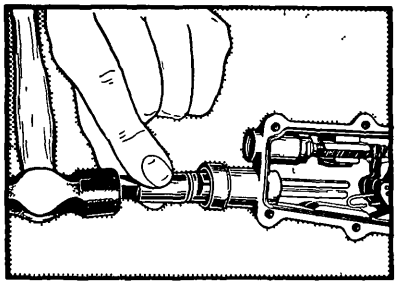
Remove primary adjusting screw plug and aasket assembly. Check "C" dimension with throttle valve closed Correct by turning primary adjusting screw

14.



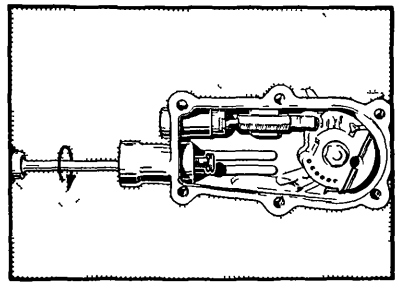
Check "B" specification Hold throttle valve closed This will make it easy to count the number of **active** coils Start with the first complete coil from the loop end. The active coils end at the entering edge of the primary adjusting screw thread. If the number of ac tive coils **is not within one coil** of "B" specification, indications are that the spring has been tampered with and recalibration of "C" specification, with the adjusting nut, is necessary.

NOTE. If it is necessary to correct "B" speci fication and no fiber washer is found pressed against primary adjusting nut, proceed to operation 21 However, if fiber washer is found proceed with operation 15.



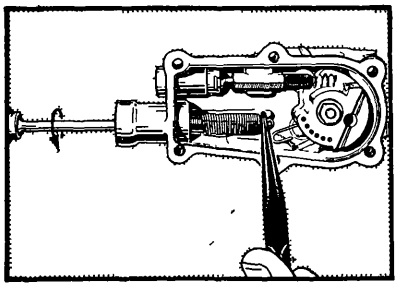
15.

Unhook the primary spring from link and, using a narrow screw driver, turn the primary adjusting screw clockwise out of the adjusting nut.



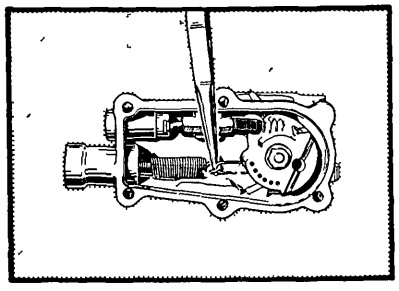
16.

Remove adjusting nut assembly and fiber seal. To do this place a fiber drift inside the governor housing against the adjusting nut and drive out of primary adjusting screw passage



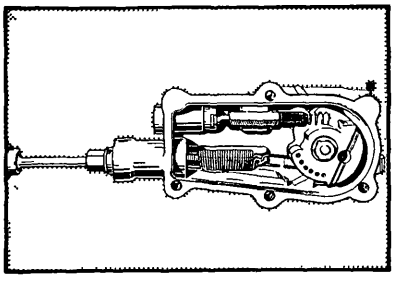
17.

Install a new adjusting nut by driving it against its seat (use tool T109-185).
CAUTION: Indentify nut by number stamped on face of nut assembly.



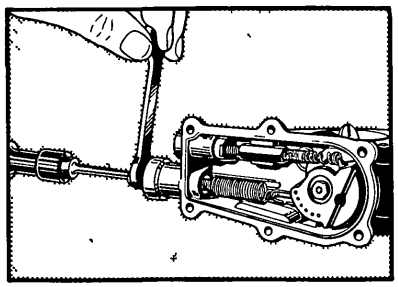
18.

Install new primary adjusting screw (start from inside of the governor housing). Turn screw counter clockwise until all but a few threads have engaged the adjusting nut.
CAUTION: Number on adjusting nut and primary adjusting screw **must** be the same.



19.

Install primary spring by inserting **tail of spring in slot in governor housing** and turn primary screw into spring.

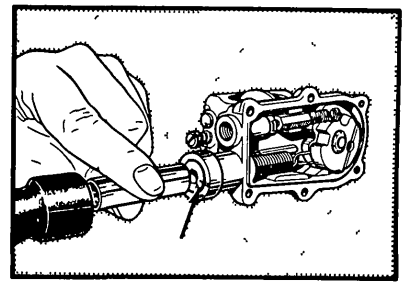


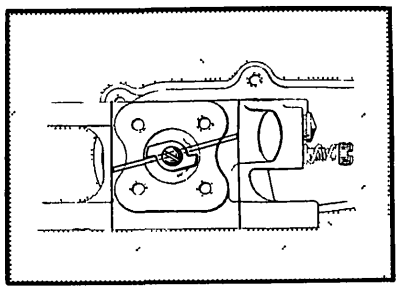
20.

Hook spring to governing lever link

21.

Adjust "B" specification with screw driver and adjusting tool T109-185 in place.



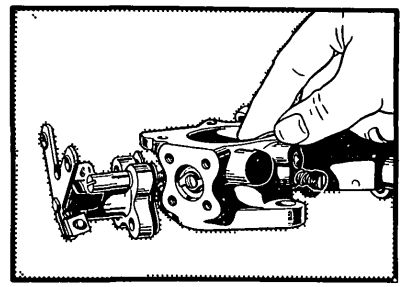


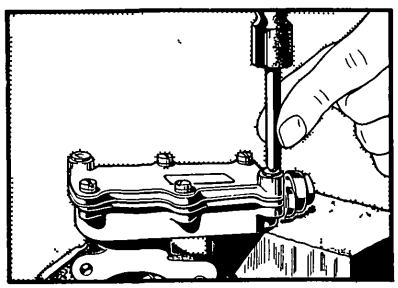
22.

Set "C" dimension by holding primary adjusting screw stationary with screw driver and turning adjusting nut with wrench on tool T109-185 until correct dimension is obtained

23.

After making certain of correct adjustment, insert fiber washer over primary adjusting screw to seal adjusting nut (A section of ¼" pipe will suffice)





24.

Inspect throttle shaft pick-up dog for wear. Replace if necessary Position of pick-up dog in relation to throttle valve **must** be as shown in illustration
CAUTION Draw into place with screw and lock washer Do not tap end of throttle shaft Excessive tightening will shear the screw

25.

After making certain that throttle lever assembly is pressed on the shaft (stub) as far as it will go to eliminate end play, install shaft housing and lever assembly with throttle valve closed and lever assembly in open position. **Be sure throttle stop screw is in position marked in operation 4.**

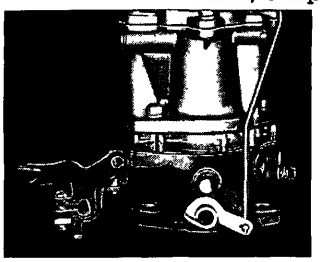
26.

Install governor housing gasket and cover assembly Place lead shot (Part No. 103-11) in the two depressed screw openings and while supporting governor housing, tamp into place and stamp with identifying tool

27.

Install carburetor on engine and adjust for desired performance, then seal primary and secondary adjusting screw plugs with lead seals (Part No 163-37)

COMPLETE GOVERNOR ADJUSTMENTS ARE CONTAINED IN CARTER VELOCITY GOVERNOR INSTRUCTION SHEET.



FORM 3501B

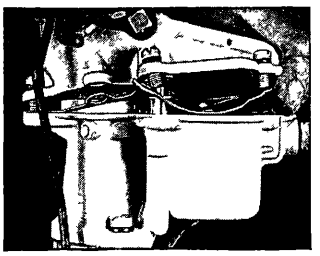
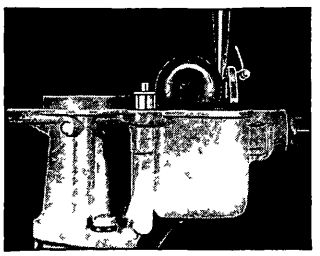
CARTER CARBURETOR
DIVISION OF acf INDUSTRIES INCORPORATED
ST LOUIS, MO, U S A

SERVICE PROCEDURE



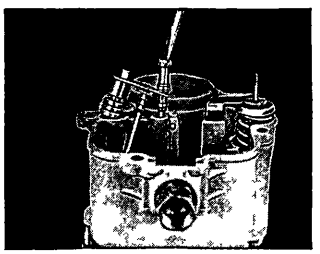
BB DOWNDRAFT CARBURETER FOR INTERNATIONAL HARVESTER TRUCKS

A fast, simple, Circuit method of servicing. Use Carter tool kit. BE ACCURATE



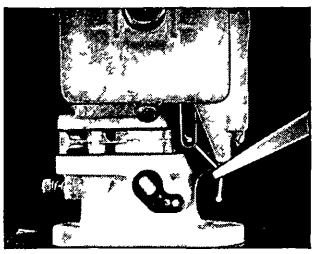
1.

Remove throttle lever assembly.



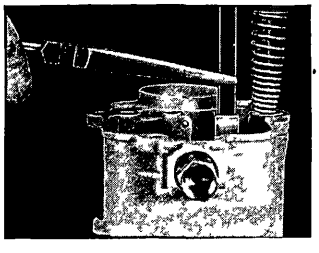
2.

Remove air horn assembly.
Remove body gasket
Disconnect throttle connector rod at upper end



3.

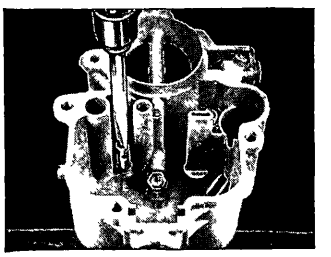
Remove float and lever assembly, float pin and retainer.



4.

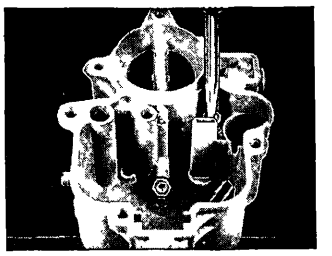
Remove idle orifice tube and plug assembly, step-up piston plate and rod assembly, step-up piston spring and gasket.

5.



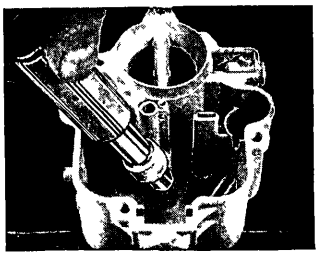
Remove pump connector link.

6.



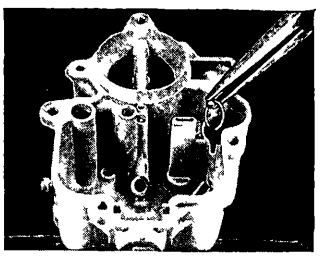
Remove pump plunger and rod assembly intact, and separate plunger from pump lifter link.

Copyright 1947
Copyright 1948
by Carter Carburetor Corporation
All Rights Reserved



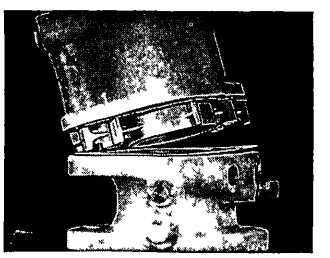
7.

Remove step-up jet and gasket assembly.



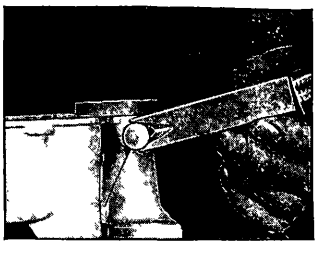
8.

Remove pump check plug and discharge check ball.



9.

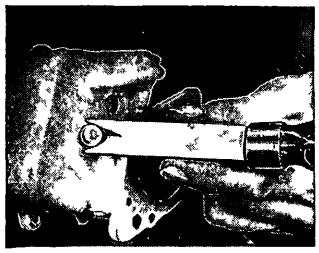
Remove main metering jet and gasket assembly.



10.

Remove pump retainer ring and intake check ball.

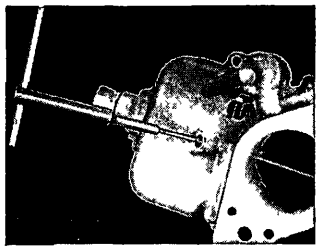
11.



Remove body flange assembly and insulator from body.

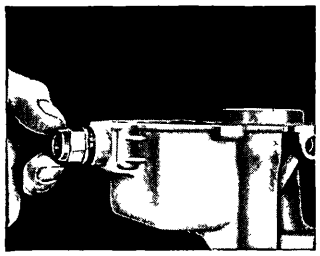
12.

Remove pump jet rivet plug and pump jet.



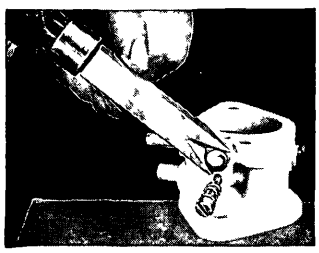
PRINTED IN U S A

13.



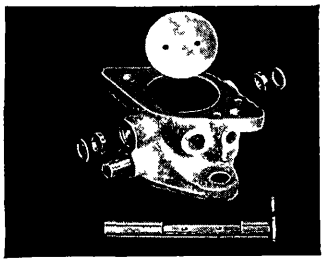
R move main v nt tub rivet plug.

(For high altitude and Export carbureter unscrew high speed adjusting needle assembly)



14.

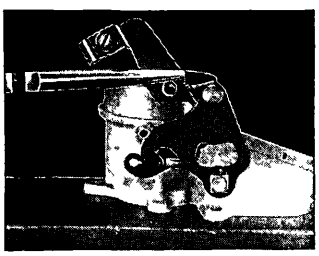
Remove main vent tube.
Use tool T109 195



15.

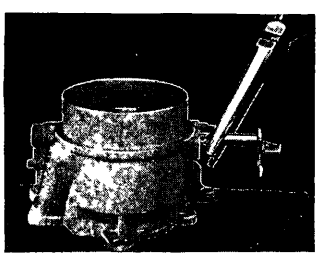
Remove needle seat and gasket.

16.



Remove idle adjustment screw and spring, then idle port rivet plug.

17.

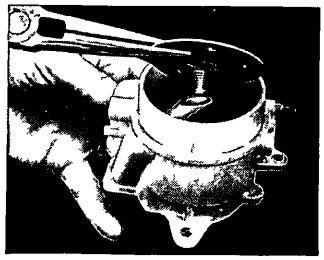


Remove throttle valve and throttle shaft and arm assembly. On carbureters having throttle shaft seals, remove retainer and seals.

CAUTION: Do not submerge flange in cleaning solvent un til retainer and seals have been removed

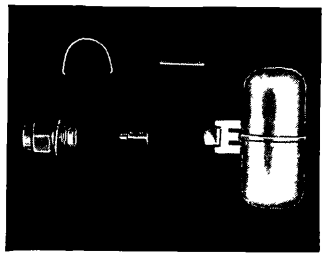
18.

Remove choke tube bracket assembly.



19.

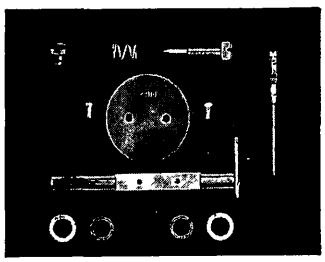
Remove choke valve screws and chok shaft and l ver assembly.



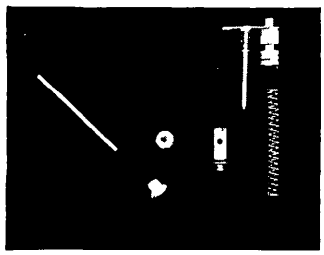
Check for wear and loose lever on shaft

20.

Remov chok valve.
Clean castings and all parts thoroughly with solv nt or any good carbureter cleaner. Scrape all carbon from bore of casting

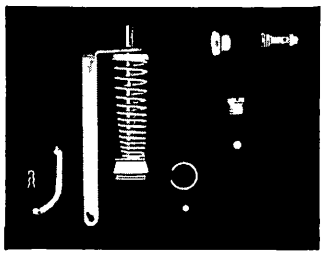


TO REASSEMBLE



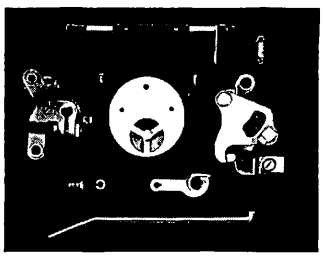
21.

Group parts controlling gasoline level.



22.

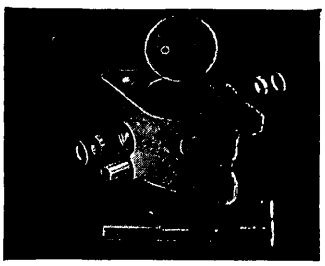
Group parts controlling idle circuit.



23.

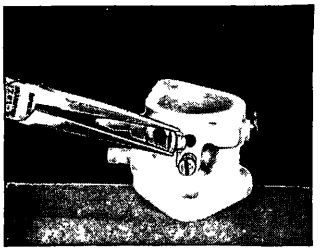
Group parts controlling high speed circuit.

24.



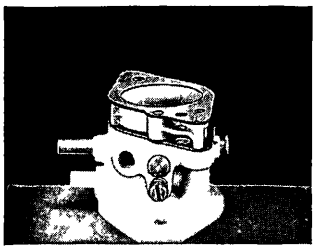
Group parts controlling pump circuit.

25.



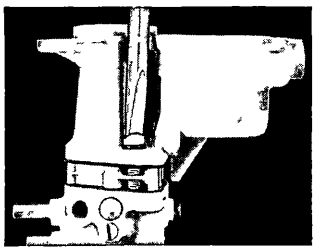
Group parts controlling choke circuit.

Examine each part in the five groups and replace any part that shows wear, or does not meet specifications



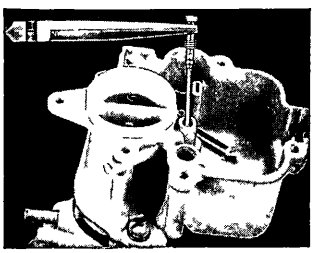
26.

With manifold side of flange down, install throttle shaft s als, r tain rs, thr ttle shaft and arm ass mbly, th n throtl valve.
Small "c" in circle should b toward idle port, and facing downward. Center valv by tapping lightly and hold in plac b f o r tightening screws Us new scr ws



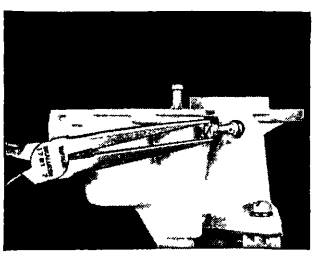
27.

Install new idle port rivet plug first, then install idl adjustment screw and spring. Back out seated screw to specifications



28.

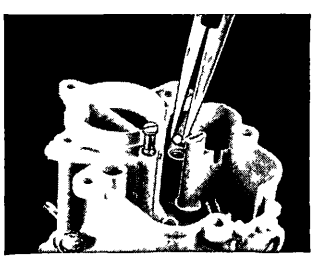
Install insulator and gaskets. Use new gaskets. Be sure that holes in casting, insulator and gaskets line up properly.



29.

Install body castings and securely tighten screws. Don't forget lock washers

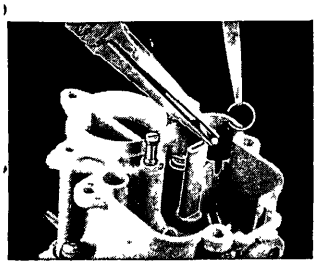
30.



Install idle orifice tube. Do not tighten—leave it loose.

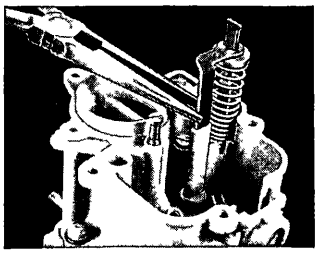
31.

Install pump jet and pump jet rivet plug.



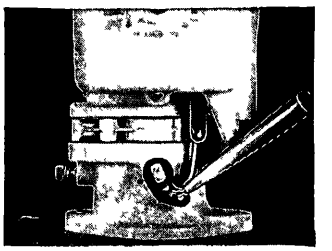
Be sure jet is clear of all restrictions and seats properly.

32.



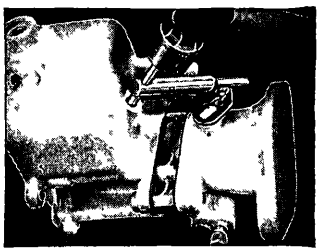
Install pump discharge check ball and plug.

Discharge ball is large ball. Be sure to put check balls in correct passages



33.

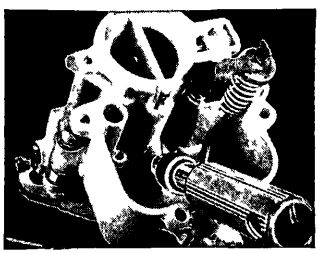
Install pump intake ch ck ball and pump retainer. Intake ball is small.



34.

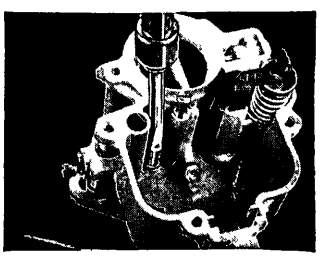
Install pump plung r and rod ass mbly, pump spring and pump lifter link.

35.



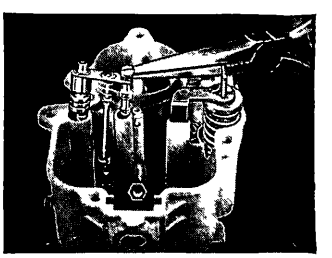
Install pump connector link and pin spring. Connect in center hole in 3 hole levers, inner hole in 2 hole levers.

36.



Install main vent tube, then main vent tube rivet plug.

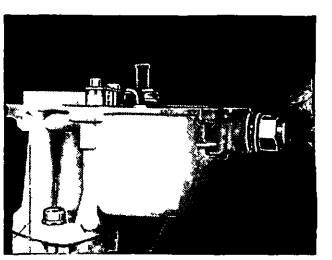
Tool T109-195 must be used to install new tube. Never reuse an old vent tube or plug.



37.

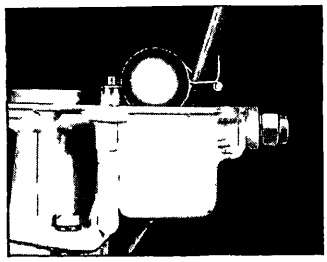
Install main metering jet and gasket assembly.

38.



Install step up jet and gasket assembly.

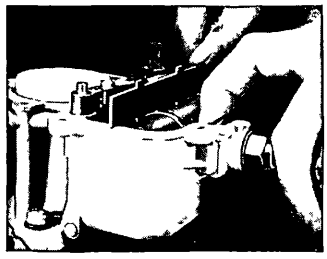
39.



Install step-up piston gasket, spring and step-up piston plate and rod assembly. Press piston down with finger while tightening idle orifice tube.

Check springs for damage.

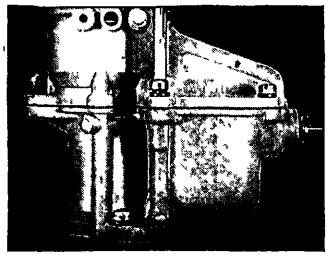
40.



Install needle seat and gasket. Then install needle. If needle or seat shows wear, replace both parts.

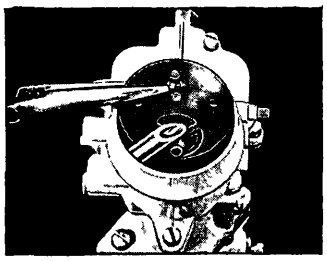
41.

Install float and lever assembly, float pin and float lever pin retainer.



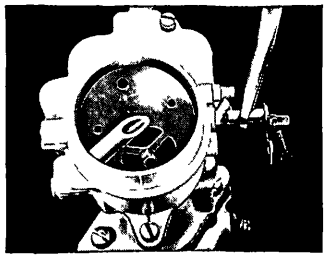
Check float for dents and for wear on float lip or pin.

42.



Set float level.

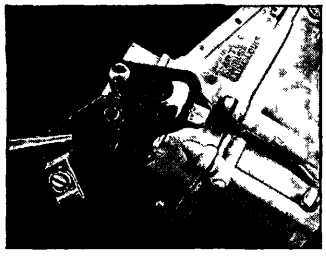
Set float level to specifications. Bend lip, not float.



43.

Install air horn assembly.
Use new gasket.

44.

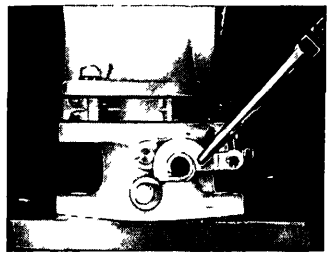


Install choke valve.

45.

Install choke shaft and lever assembly with spring attached.

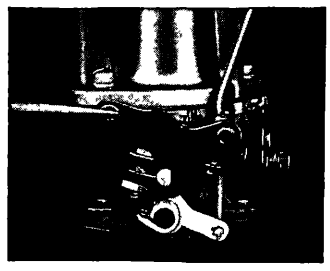
Use new screws. Center valve by tapping lightly before tightening screws.



46.

Install choke bracket assembly.
Attach spring.

47.



Install fast idle rod and fast idle cam. Place cam on cast iron boss.

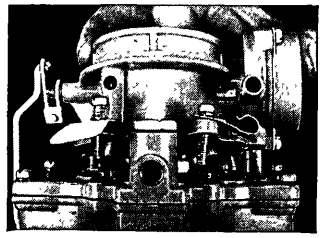
Check rod and cam for wear.

48.

Install throttle lever assembly.
Tighten screws securely.
Protect your work with a Carter Airdome or Ceramic Filter.

Note: New flange gasket should be used when installing carbureter on manifold. On cars without governor, gasket with 4 slots should be used; on cars with governor, gasket with 4 small holes should be used between carbureter and governor, the original gasket with 4 slots to remain on manifold beneath governor.

Always use complete new gasket assortment when servicing a Carter Carbureter.



NO CARBURETER CAN DELIVER GOOD MILEAGE OR PERFORMANCE UNLESS COMPRESSION IS NORMAL AND THE MOTOR IS PROPERLY TUNED.

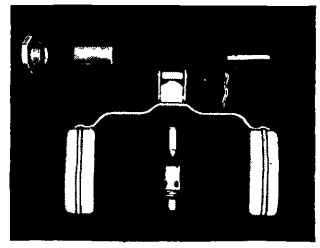
7.

Remove all parts from body flange assembly.

Check throttle shaft for wear, loose lever and throttle rod holes in lever for wear.

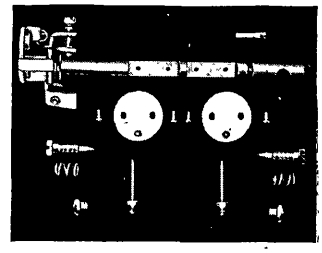
(NOTE: Wash all parts in clean gasoline **except coil and housing assembly, cork pieces and switch parts.** Blow out all passages with compressed air and scrape carbon from bores of flange and replace all worn or damaged parts.)



TO REASSEMBLE

8.

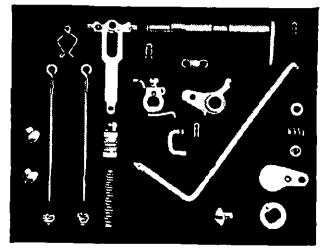
Group all parts controlling gasoline level.



No. 1. Float circuit.

9.

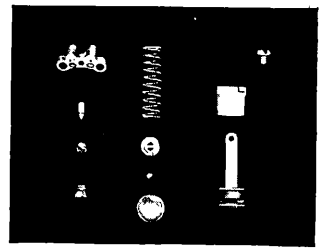
Group all parts controlling idle operation.



No. 2. Low speed circuit.

10.

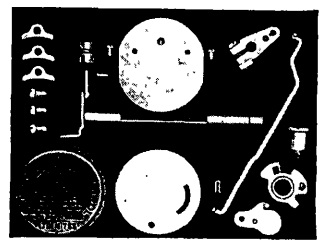
Group all parts controlling high speed operation.



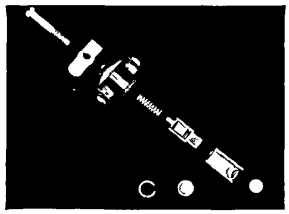
No. 3. High speed circuit.

11.

Group all parts controlling pump operation.



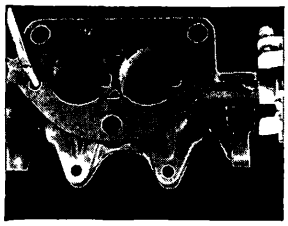
No. 4. Pump circuit.



12.

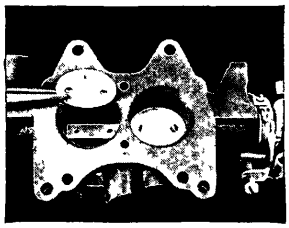
Group all parts controlling choke operation.

No. 5. Choke circuit.



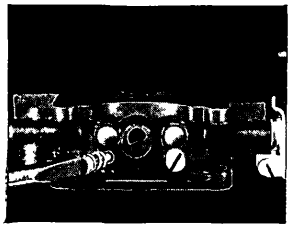
PRINTED IN U.S.A.

13.



Group all parts controlling switch operation.

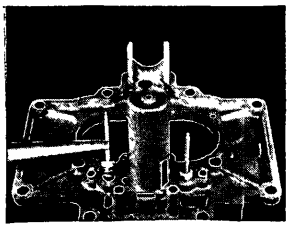
14.



Idle Circuit. Install throttle shaft and lever assembly and throttle centering screw.*

Back out throttle lever adjusting screw.

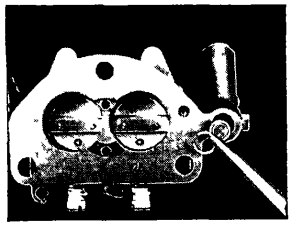
15.



Install throttle valve.
Small "c" in circle (or part number) should be toward idle port when viewing casting from manifold side. Center throttle valves by tapping lightly and hold in place with fingers before tightening screws. Always use new screws.

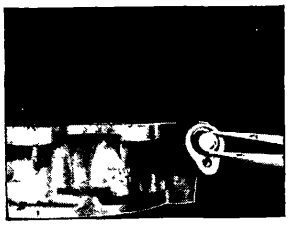
16.

Install idle port rivet plugs, then idle adjustment screws and springs.



Set idle adjusting screws to specifications.

17.

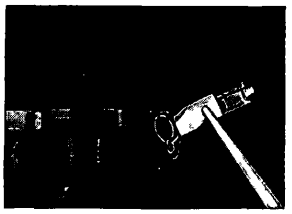


Install low speed jet assemblies.

No gaskets are used.

18.

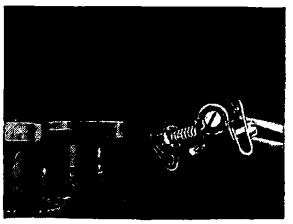
Starter Switch. Install switch strainer and retainer.



19.

Install switch ball.

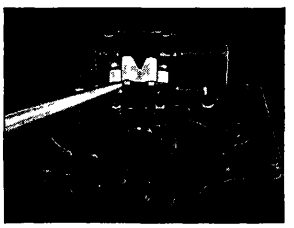
20.



Install switch plunger, guide block and "W" shaped switch contact spring.

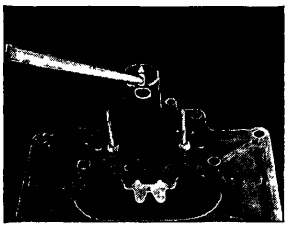
Do not forget to reinstall shims under contact spring.

21.



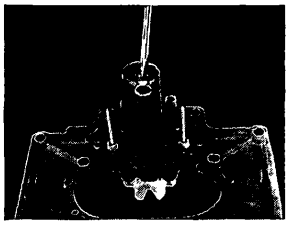
Install switch return spring, terminal cap assembly, hold down clip and attaching screw.

22.



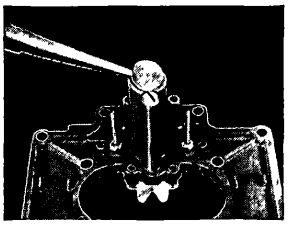
Pump Circuit. Install air horn gasket, then pump jet and housing assembly.

Use new gasket.



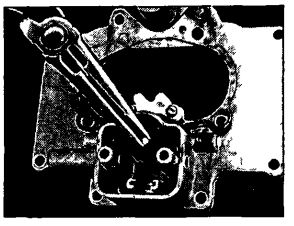
23.

Install pump check needle, blunt end first.



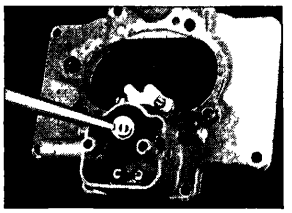
24.

Install discharge check plug first, then pump discharge passage plug.



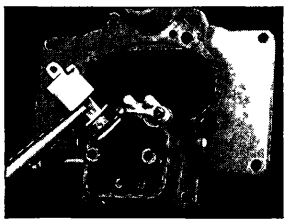
25.

Install pump strainer.



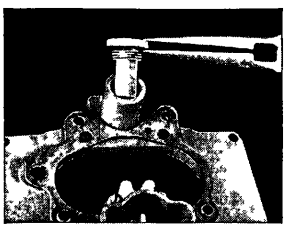
26.

Install intake ball check.



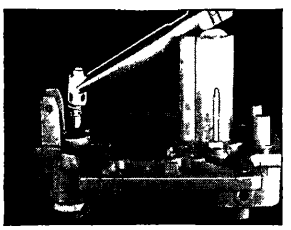
*Late models use throttle centering washer—refer to specification page for installation instructions.

27.



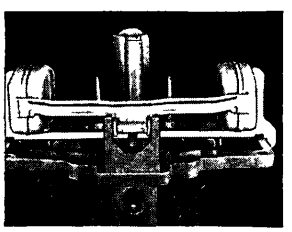
Install ball ch ck retainer.

Use sleeve from tool T109-122U to put cap firmly in poistion



28.

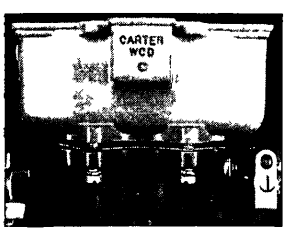
Install pump spring, plunger assembly and plunger guide.



29.

Float Circuit. Install bowl strainer gauze and nut and gasket assembly.

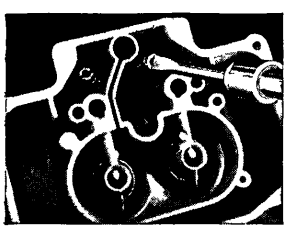
30.



Install needle a n d seat assembly.

31.

Install float and l e v e r assembly.



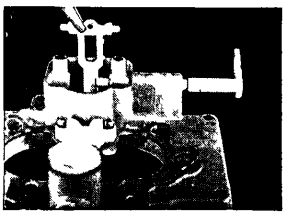
Use gauge T109 160 or T109 162 With bowl cover inverted, place gauge directly under float with notched portions fit ted over machined edge of casting Float should just touch vertical sides of gauge and just clear horizontal portion Carefully remove float, install bowl cover gasket, then replace float

32.

High Speed Circuit. Assemble body flange assembly to body casting.

Use new gasket

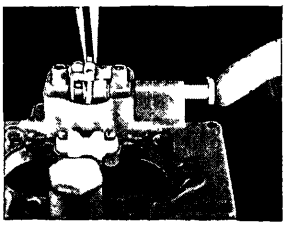
33.



Install metering r d j ts.

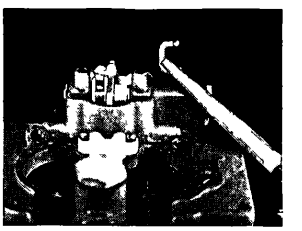
Use new gaskets Jets must be installed snugly, but not so tightly as to cause distortion

34.



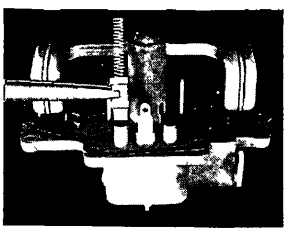
Install vacum t r piston link and m t ring rod spring.

Start pump countershaft assembly.



35.

Install pump arm and collar assembly, metering rod arm and s c r e w assembly and pump arm spring.



36.

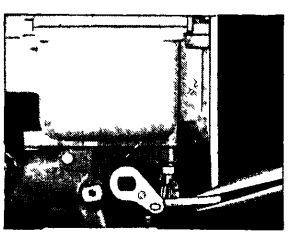
Install pump arm l i n k on pump arm and collar assembly and plunger shaft.

37.

Install vacuum piston and pin assembly, and vacuum piston spring on piston link.

38.

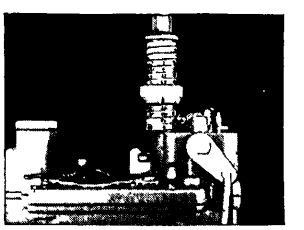
Install body on bowl cover as assembled.



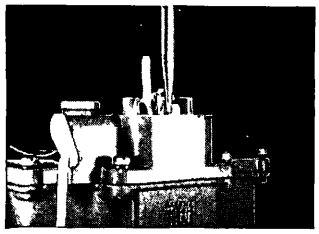
Use new gasket

39.

Install throttle shaft lever and throttle connector rod.



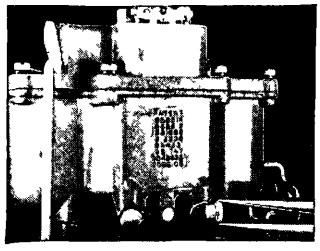
Do not forget throttle shaft washer



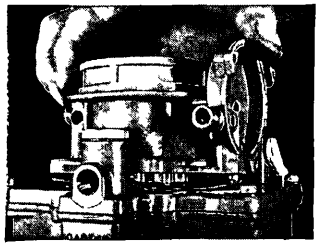
40.

Mak pump adjustm nt. Us tool T109-117S.

See specifications for instruc tions

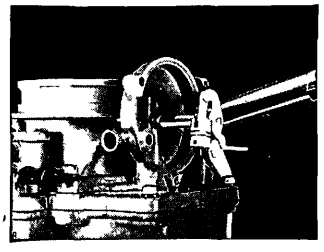


41.



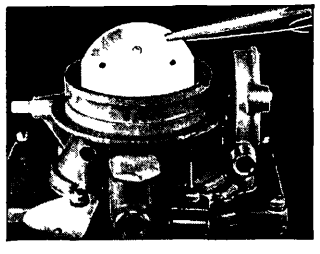
Adjust m t ring r ds.

Install metering rod gauge in place of rod Press down on piston link adjust lip on metering rod arm to just make contact when throttle valves are completley closed Remove gauge and install metering rods



42.

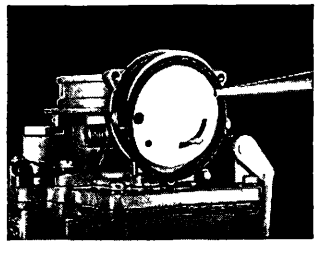
Install nozzle passage rivet plugs.



43.

Choke Circuit. Install air horn casting.

44.

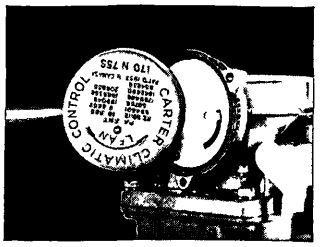


Install choke piston, lever, link and shaft assembly, and piston.

45.

Install choke valve.

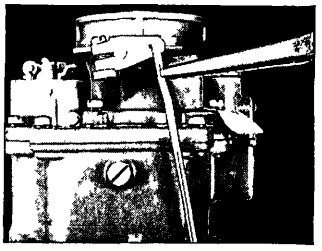
Use new screws Seat choke valve by tapping lightly, hold in place with finger before tightening screws Valve or shaft must not bind in any position



46.

Install coil housing baffle plate and coil housing gasket.

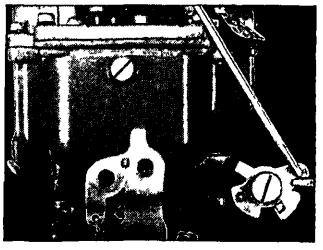
47.



Install thermostatic coil and housing assembly.

Install housing with indicator marks at bottom Revolve housing clockwise and set index mark as stated in specification sheet, then tighten attaching screws

48.



Install choke lever and screw assembly and fast idle connector rod.

49.

Install fast idle cam assembly.

Make unloader and fast idle adjustments (see below) and starter switch adjustment using tool T109 155S

UNLOADER ADJUSTMENT: Two adjustments are necessary to get correct unloader setting Loosen choke lever and screw assembly on shaft Insert 010" flat feeler gauge between lip on fast idle cam and boss on flange casting Hold choke valve closed and tighten choke shaft arm. Then adjust unloader lip on throttle shaft lever to give specified clearance between upper edge of choke valve and inside wall of air horn with throttle wide open

FAST IDLE ADJUSTMENT: With choke valve tightly closed adjust fast idle set screw to give specified clearance between throttle valve and bore of carbureter (side opposite port)

Always use complete new gasket assortment when servicing a Carter Carbureter.

NO CARBURETER CAN DELIVER GOOD MILEAGE OR PERFORMANCE UNLESS COMPRESSION IS NORMAL AND THE MOTOR IS PROPERLY TUNED.

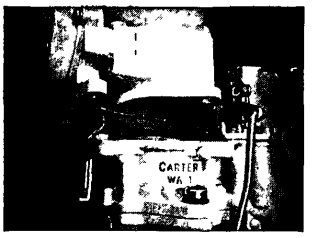
SERVICE PROCEDURE

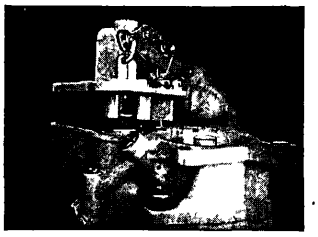
WA-1 CLIMATIC® CONTROL CARBURETER



A fast, simple, Circuit method of servicing Carter WA-1 Climatic® Control Carbureters. Use Carter tool kit.

BE ACCURATE.

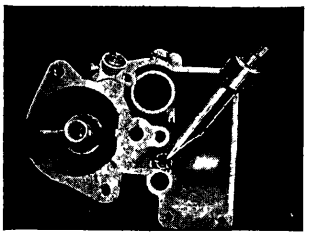
1.



Remove fast idle cam and pin assembly.

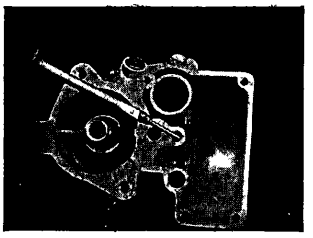
2.

Remove air horn and climatic® control assembly.



Lift off air horn gasket.

3.

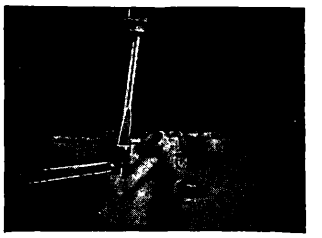


Disconnect throttle connector rod; then remove bowl cover with all parts attached. Remove throttle shaft arm assembly.

Check throttle connector rod for wear at both ends, and hole in pump arm. Remove bowl cover gasket and pump spring.

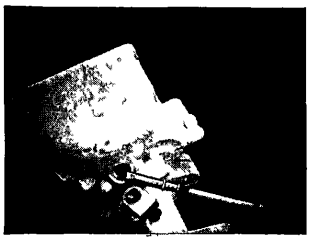
4.

Remove metering rod jet and gasket assembly.



5.

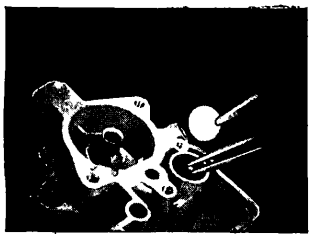
Remove low speed jet assembly.



6.

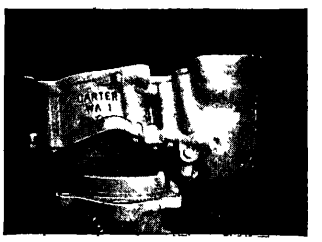
Remove pump jet plug and gasket assembly and pump jet.

7.



Remove pump discharge ball retainer and gasket, and check ball.

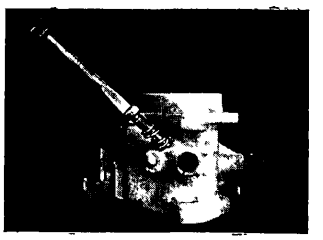
8.



Remove nozzle passage plug, nozzle retainer plug and nozzle.

Be sure to remove small nozzle gasket from casting

9.



Remove pump strainer, and pump intake check ball.

10.

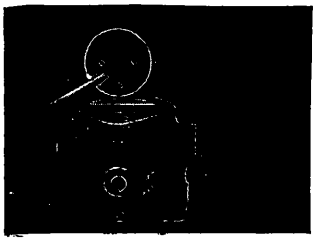
Separate body from flange assembly.

Remove body flange gasket.

11.

Remove idle adjustment screw and spring.

Check for groove on seating surface.



12.

Remove idle port rivet plug.

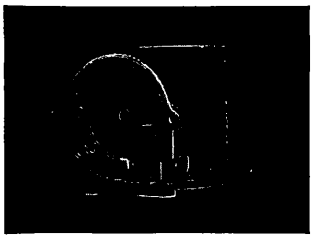
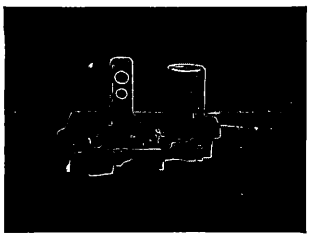
CARBURETER
TRADE MARK REG. U. S PAT. OFF.
MARCA REGISTRADA



PRINTED IN U.S.A.

13.

Remove throttl valve scr ws, valve and throttle shaft and lever assembly.

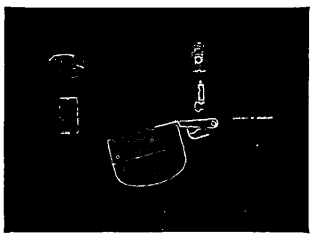


Do not remove baffle plate from carbureter casting. Check shaft for wear, loose lever and throttle rod hole in lever for wear.

14.

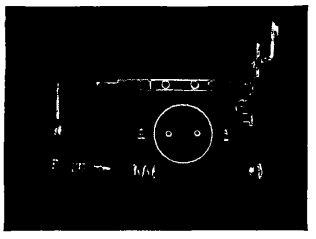
Remove all parts from air horn.

Do not remove piston housing attached to air horn with rivet



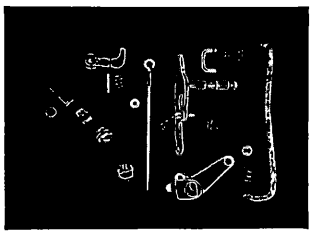
15.

Remove all parts from bowl cover.



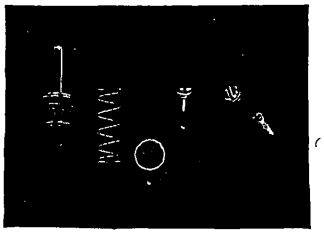
TO REASSEMBLE

(See note at bottom of page)



16.

Group parts controlling float circuit.

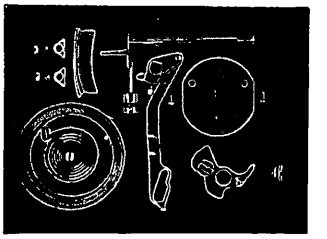


17.

Group parts controlling low speed circuit.

18.

Group parts controlling high speed circuit.

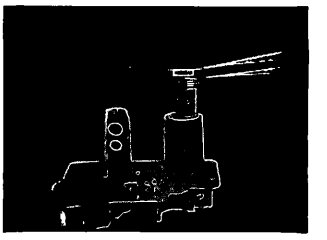


19

Group parts controlling pump circuit.

20.

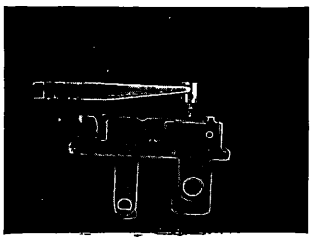
Group parts for choke circuit.



Examine each part in the five groups and replace any part that shows wear, or does not meet specifications

21.

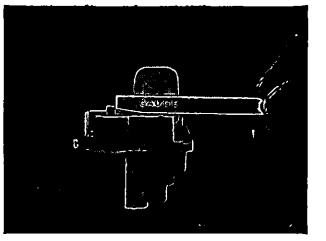
Install strainer and strainer nut and gasket assembly.



Use new gasket

22.

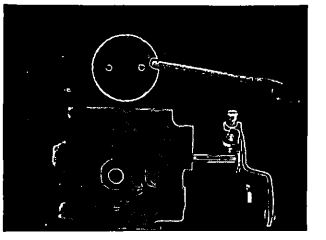
Install needle seat and gasket assembly.



Check for wear If either needle or seat shows wear, replace both

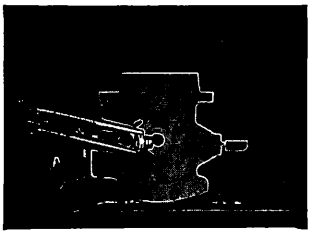
23.

Install needle, float and lever assembly, float lever pin.



Check float for dents and wear on lip, and float pin for wear Check bowl cover for wear in countershaft hole. Set float level to specifications by bending lip, not float Measure distance from projection on bowl cover to soldered seam of float, as shown

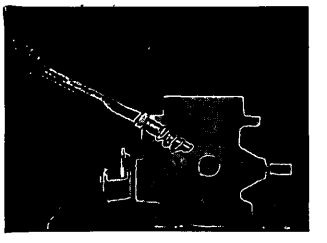
24.



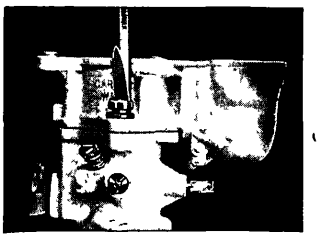
Install throttle shaft and lever assembly and throttle valve.

Small "c" in circle should be toward idle port facing manifold side of flange. Center valve by tapping lightly before tightening screws Use new screws. Back out throttle lever adjusting screw before installing

25.



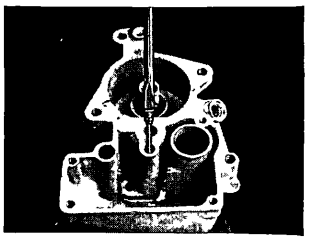
Install idle port rivet plug.



26.

Install idle adjustment screw and spring.

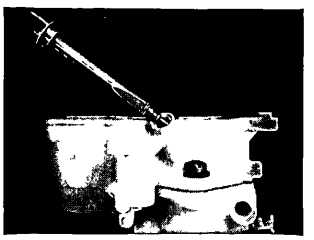
Back out from seated position to specifications



Not : Clean casting and all parts thoroughly, except cork pieces and coil and housing ass mbly, with cl an gasoline. Paint outsid of body casting with Carter Sp cial Body Finish Be sure Finish does not r strict passag s.

27.

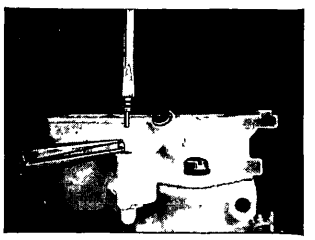
Ass mbl body and body flang assembly.



Use new gasket. Pull screws down evenly. Don't forget lock washers.

28.

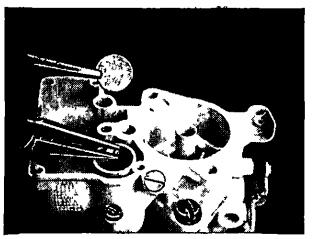
★Install low speed jet assembly.



Be sure jet seats firmly in casting.

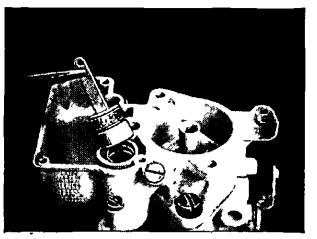
29.

Install pump jet and pump jet passage plug and gasket assembly.



Be sure jet is clear of all restrictions and seats properly. Use new gasket on passage plug.

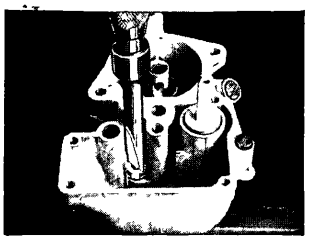
30.



Install pump check ball and pump discharge ball retainer and gasket.

Use new gasket.

31.



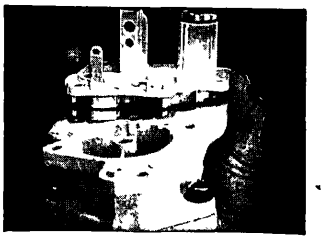
Install pump intake check ball and pump strainer.

32.

Install pump spring and pump plunger and rod assembly.

Examine leather for damage. If not in good condition, replace entire assembly.

33.

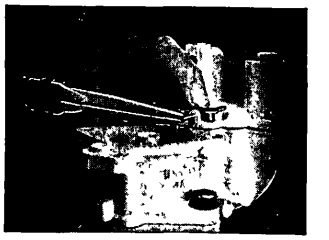


Install metering rod jet and gasket assembly.

Examine for wear. If jet is worn, replace both metering rod and jet. Use new gasket.

34.

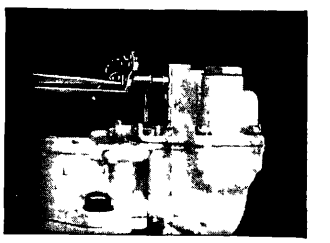
Install bowl cover ass mbly.



Use new gasket. Pull screws down evenly. Install idle passage plug and gasket assembly (center of bowl cover).

35.

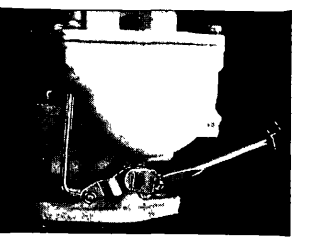
Install anti-percolator cap and rocker arm assembly and spring.



Make certain that leather is in good condition and that pin is not worn.

36.

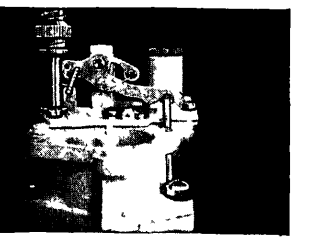
Install pump arm and countershaft assembly.



Install connector link on pump shaft and in proper hole in pump arm.

37.

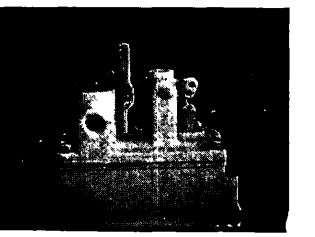
Install throttle shaft arm and screw assembly and throttle connector rod.



Check throttle shaft arm for wear.

38.

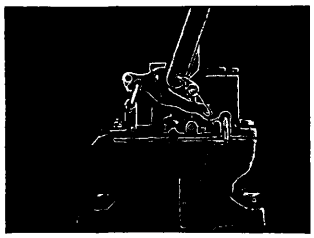
With throttle connector rod in place, adjust pump stroke.



Use universal pump travel gauge T109-117S. See specification sheet for correct pump plunger travel. Adjustment is made by bending throttle connector rod at lower angle.

39.

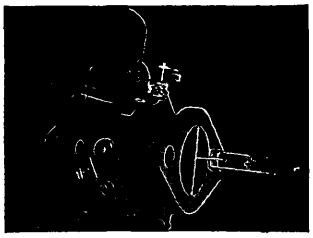
Adjust metering rod.



See footnote at bottom of page.

Metering Rod Adjustment: Adjust metering rod after pump adjustment is made. Insert metering rod gauge in place of metering rod, seating tapered end in jet. With throttle valve seated, there should be less than .005" clearance between metering rod pin and shoulder in notch of gauge. Adjustment can be made by bending metering rod pin portion of pump arm up or down as shown in illustration No. 40. **(See page 4 for metering rod adjustment for vacum ter carbureters.)** Remove gauge, install rod and disc, and connect spring.

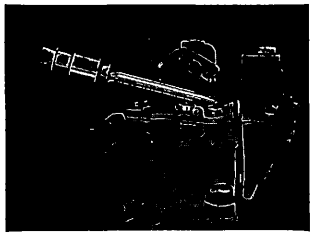
★ In cases where low speed jet extends into high speed passage, nozzle must be installed before low speed jet.



CARBURETER
TRADE MARK REG. U. S. PAT. OFF.
MARCA REGISTRADA

40.

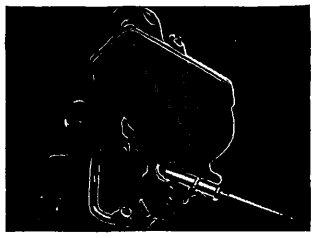
Met ring r d adjustm nt.



See footnote

41.

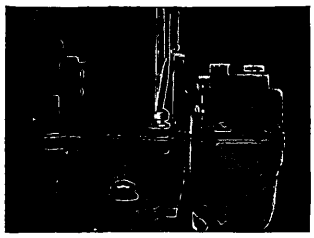
Adjust anti-percolator.



Crack throttle valve specified distance by placing gauge between valve and bore of carbureter (side opposite port) (See specification sheet)

42.

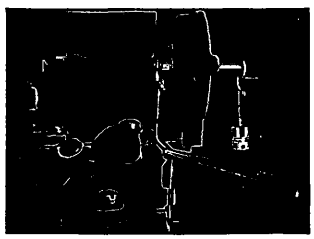
Anti-percolator adjustment.



Bend anti percolator rocker arm until there is a clearance of 005" to 015" between rocker arm and pump arm

43.

Install nozzle, nozzle retainer plug and nozzle passage plug and gasket assembly.



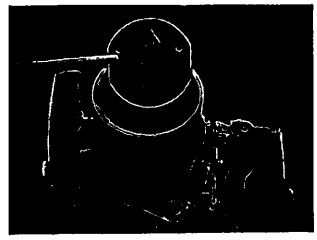
Use new gasket on nozzle and nozzle passage plug

44.

Install air horn and piston housing assembly.

Use new gasket Tighten screws evenly Don t forget lock washers

45.

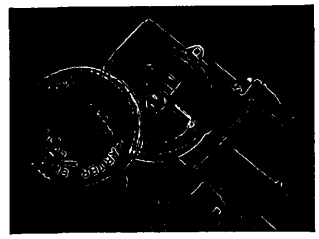


With choke lever, screw and link assembly in place, install choke shaft and piston assembly.

Check for loose lever on shaft

46.

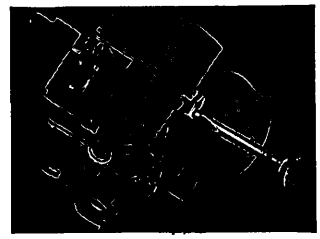
Install chok valve.



Use new screws when install ing valve. Center choke valve by tapping lightly. Hold in place with finger before tightening screws.

47.

Install piston housing strainer and thermostatic coil and housing assembly.



Install coil housing assembly with indicator marks at bottom. Then revolve housing counter clockwise and set as specified

48.

Hold choke valve wide open, then tighten choke lever screw as shown.

Be sure that linkage does not bind in any position Fast idle, unloader and lockout adjustments must be made as specified

49.

Install fast idle cam and pin assembly.

Carbureter is now ready for installation. Protect your work with a Carter Ceramic or Air dome Fuel Filter

Always use complete new gasket assortment when servicing a Carter Carbureter

NO CARBURETER CAN DELIVER GOOD MILEAGE OR PERFORMANCE UNLESS COMPRESSION IS NORMAL AND THE MOTOR IS PROPERLY TUNED.

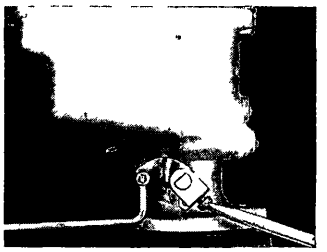
Metering Rod Adjustment (Vacumeter carbureters). Adjust metering rod after pump adjustment is made Insert metering rod gauge in place of metering rod, seating tapered end in jet With throttle valve s at d, press down lightly on piston link directly over piston There should be less than 005" clearance between metering rod pin and shoulder of notch in gauge Gauge must not drag on pin Adjustment can be made by bending lip on piston link so that it contacts hump on pump arm Remove gauge install rod and disc and connect spring

SERVICE PROCEDURE

W-1 CLIMATIC CONTROL CARBURETER

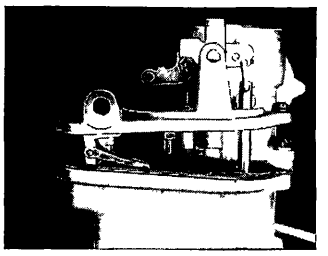
A fast, simple, Circuit method of servicing Carter W-1 Climatic Control Carbureters. Use Carter tool kit



BE ACCURATE

1.

Remove throttle connector rod at pump arm.



Check for wear at upper end of rod and hole in pump arm

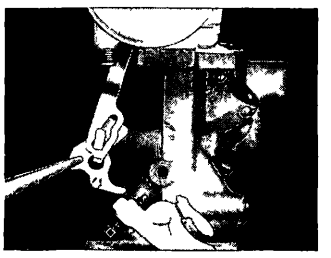
2.

Remove throttle connector rod and throttle shaft arm.

Check for wear at lower end of rod and hole in arm

3.

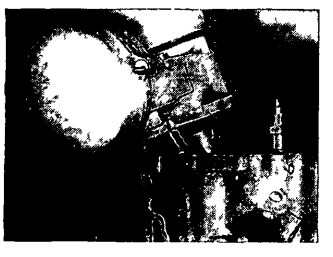
Remove bowl cover with all parts attached.



(On 1934-35 models, air horn must be removed before bowl cover is removed.)

4.

Remove nozzle passage plug and nozzle.

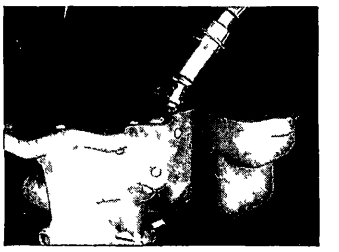


Be sure to remove small nozzle gasket from casting

5.

Remove fast idle cam and pin assembly and screw.

Disconnect from fast idle link



6.

Remov air horn and climatic c ntrol assembly.

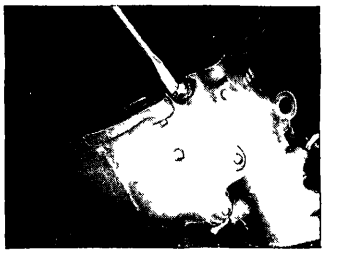
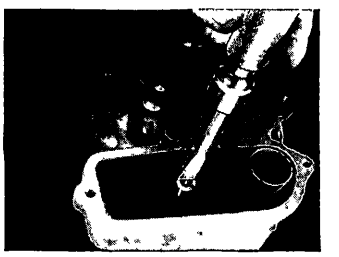
by Carter Carburetor Corporation
All Rights Reserved

7.



Remove anti-percolator assembly.

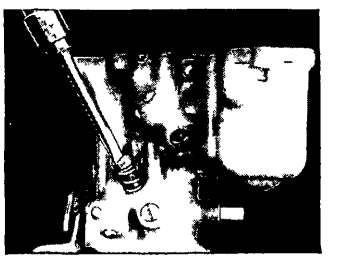
8.



Remove pump jet passage plug and pump jet.

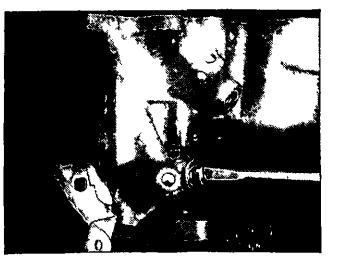
Be sure to remove small copper washer from casting

9.



Remove metering rod jet and gasket assembly.

10.

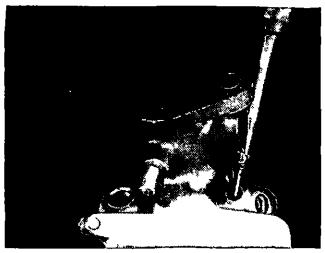


Remove idle adjusting screw and spring.

Check for groove on seating surface.

11.

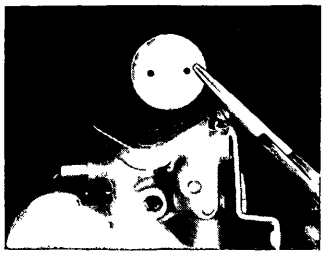
Remove idle port plug.



12.

Remov check valve passage plug strainer, intake and discharg ch ck valves.

Remov copper wash r from casting.



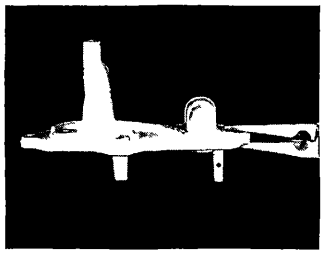
PRINTED IN U.S.A.

13.

★Remove low speed jet.

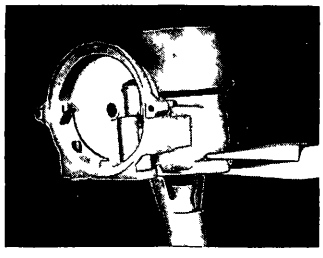
Remov small copper washer from casting

14.



Remove throttle valve.

15.

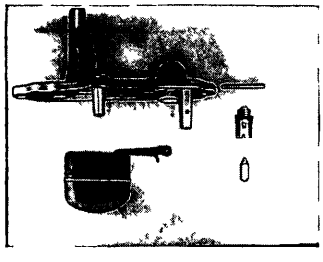


Remove throttle shaft and lever assembly.

Check shaft for wear, loose lever and throttle rod hole in lever for wear

16

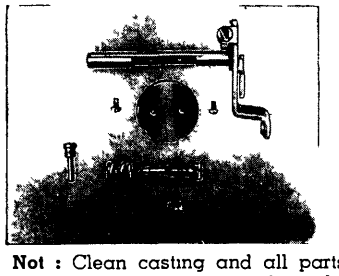
Remove all parts from bowl cover.



17.

Remove all parts from air horn.

Do not remove piston housing attached to air horn with rivet

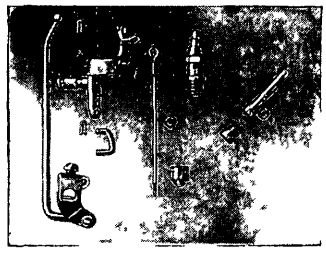


(See note at bottom of page)

TO REASSEMBLE

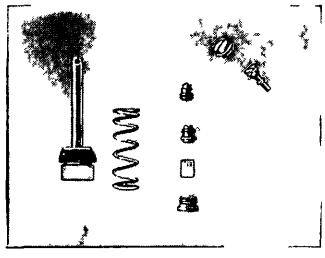
18.

Group parts controlling the gasoline level.



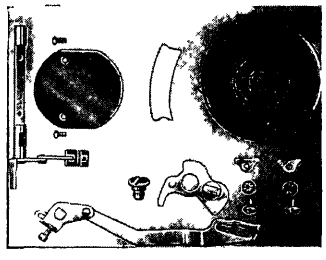
19.

Group parts controlling idle circuit.



20.

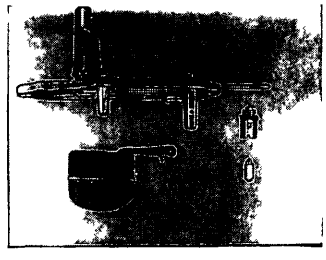
Group parts controlling high speed circuit.



21.

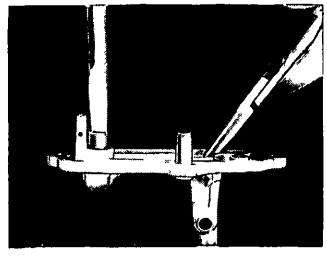
Group parts for pump circuit.

22.



Group parts for choke circuit. Examine each part in the five groups and replace any part that shows wear, or does not meet specifications

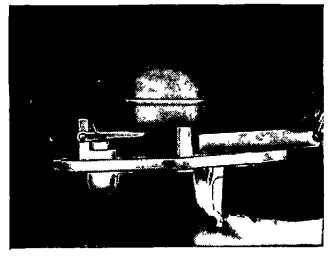
23.



Assembly parts that control gasoline level as shown.

Check float for dents and wear on lip and float pin for wear Check bowl cover for warpage and wear in countershaft hole If needle shows groove on seating surface, replace both needle and seat

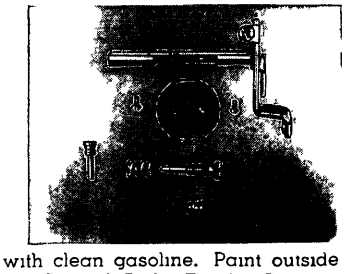
24.



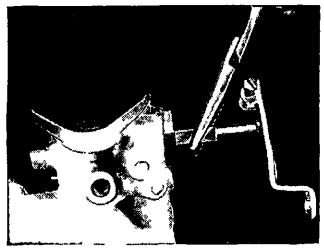
Install needle seat and gasket assembly.

25.

Install needle, float and lever assembly and float pin



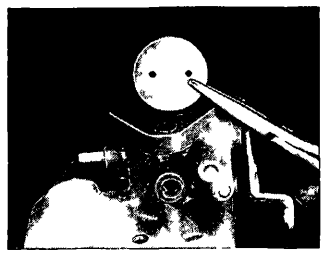
Set float level to specifications by bending lip, not float



26.

Assemble idle circuit parts as shown.

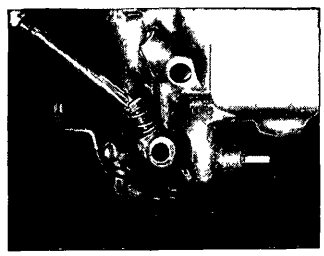
Never reinstall a used low speed jet Use new jet and new copper washer Be sure to scrape all carbon from bore of casting



Note : Clean casting and all parts thoroughly, except cork pieces and coil and housing assembly with clean gasoline. Paint outside of body casting, and inside of bowl to a depth of 1 in from top edge of casting with Carter Special Body Finish Be sure Finish does not restrict passages **★On some carburetors the low speed jet is pressed in place and cannot be removed.**

27.

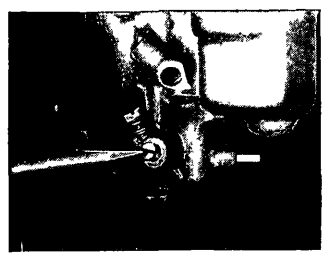
Install throttle shaft and l ver assembly.



Back out throttle lever adjust ing screw

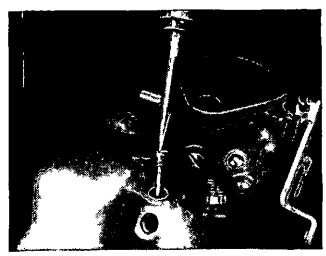
28.

Install throttle valve.



Small "c" in circle or part number should be toward idle port when viewing casting from manifold side Center throttle valve by tapping lightly and hold in place with finger before tightening screws Always use new screws

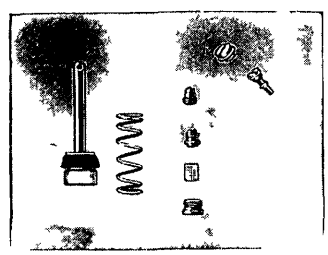
29.



Install idle adjusting screw and spring.

Back out from seated position to specifications

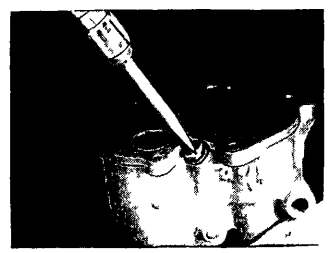
30.



Install idle port plug

31.

★Install low speed jet.



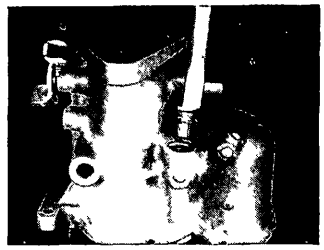
Be careful to install new cop per washer in casting before installing new jet

32.

Assemble parts for pump cir cuit.

Replace both spring and leather if leather shows wear or mutilation Test checks by blowing for free operation

33.



Install pump discharge jet and plug.

B sure jet is clear of all re strictions and seats properly Place new copper washer in casting before installing plug.

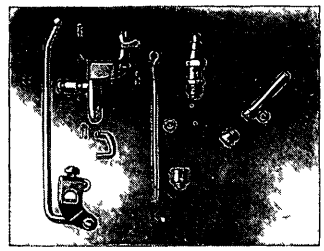
34.

Install discharge and intake checks, strainer and plug.

Place new copper washer in casting before installing plug and strainer

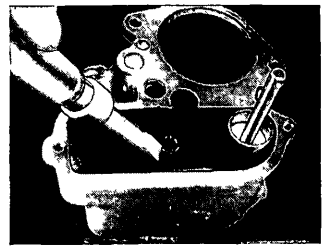
35.

Install pump spring and plunger assembly.



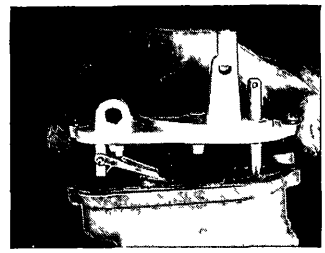
Use loading tool to avoid damage to leather

36.



Assemble parts controlling high speed circuit.

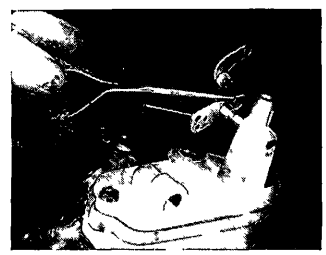
Check pump arm and coun tershaft for wear on shaft and for loose lever If metering rod shows wear, replace both rod and jet New nozzles should be used whenever carbureters are serviced Check anti percolator valve closely for dirt and wear



37.

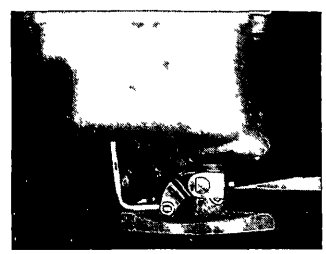
Install metering rod jet and gasket assembly

38.



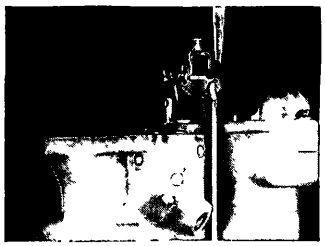
Install bowl cover assembly and gasket

39.



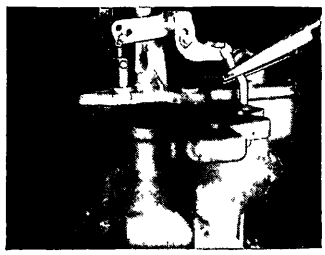
Install pump arm and coun tershaft assembly.

Connect pump shaft to pump arm with connector link



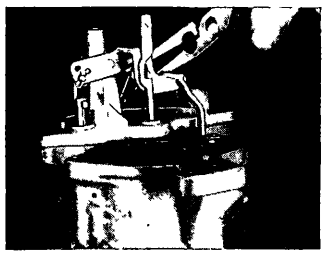
40

Install throttle shaft arm and throttle connector rod



★On some carbureters the low sp ed jet is pressed in place and cannot be removed.

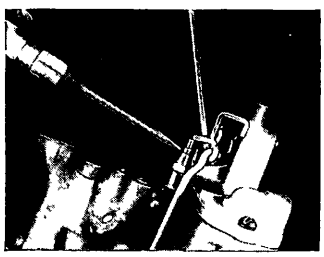
41.



Conn ct upper nd of throttle *connector rod to pump arm.*

42.

Bend throttle connector rod at lower end to give specified pump plunger travel. (This adjustment only for carbureters with specified pump stroke.)

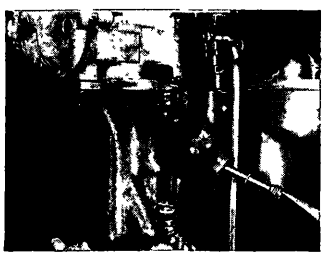


Do not bend throttle connector rod at point shown by pliers in picture. Bend at lower angle for adjustment.

43.

Install metering rod gauge.

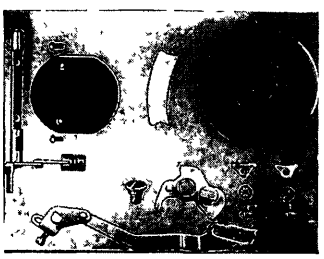
Hold gauge verticle to insure seating. For carbureters with adjustable metering rod pin, loosen nut on pin, and rest pin in notch of gauge and tighten nut (Tool No. T109-76). For carbureters with fixed pin, bend throttle connector rod so upper end centers freely in pump arm hole.



44.

Install anti-percolator valve. Seat tightly. Adjust lip on pump arm so indicator line is flush with top of anti-percolator. Then install metering rod.

45.



Install air horn.

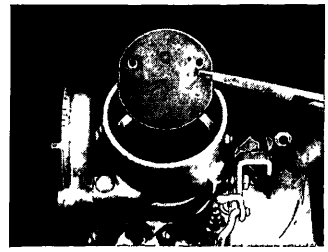
46.

Install nozzle and nozzle passage plug.

Put new gasket on nozzle before installing. Slip nozzles should always be installed with flat surface upward. Insert new copper washer in casting before installing plug.

47.

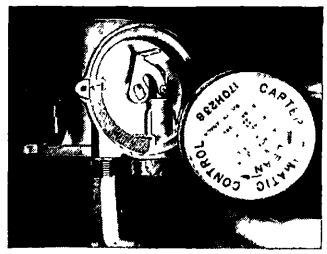
Assembl choke parts.



Check for loose lever on shaft.

48.

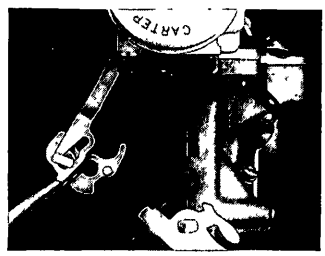
Install choke shaft and lever *assembly with piston attached.*



Be sure to install choke lever, screw and link assembly when installing choke shaft.

49.

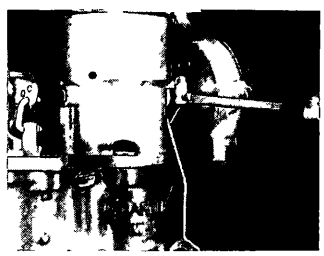
Install choke valve.



Use new screws when installing valve. Center choke valve by tapping lightly. Hold in place with fingers before tightening screws.

50.

Install strainer and thermostatic coil and housing assembly.



Install thermostatic coil housing assembly with indicator mark to bottom. Then revolve housing ½ turn counter-clockwise and set indicator as specified.

51.

Install fast idle cam and pin assembly.

Attach to body with screw

52.

Tighten choke lever screw.

Be sure that linkage does not bind in any position. Fast idle, unloader and lockout adjustments must be made as specified. Protect your work with a Carter Airdome Fuel Filter.

Always use complete new gasket assortment when servicing a Carter Carbureter.

NO CARBURETER CAN DELIVER GOOD MILEAGE OR PERFORMANCE UNLESS COMPRESSION IS NORMAL AND THE MOTOR IS PROPERLY TUNED.

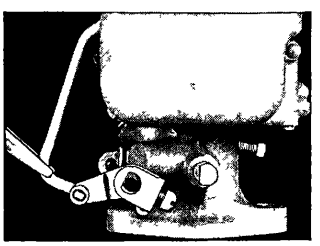
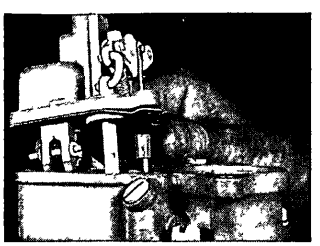
W-O CARBURETER SERVICE PROCEDURE

A fast, simple, Circuit method of servicing Carter W-O Carbureters. Use Carter Tool Kit BE ACCURATE.



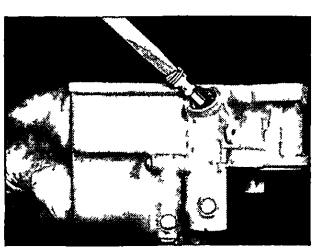
1.

Remove choke link pin spring, choke connector link and spring.



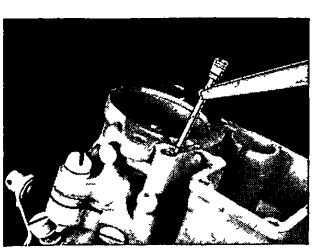
2.

Remove air horn and dust cover assembly with all parts attached.



3.

Remove throttle shaft arm and screw assembly and throttle connector rod.



4.

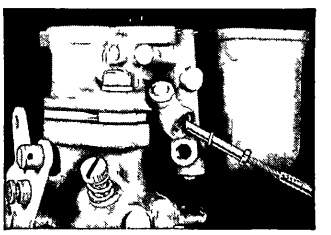
Remove bowl cover with all parts attached.

5.

Remove pump jet passage plug and gasket assembly, and pump jet.

6.

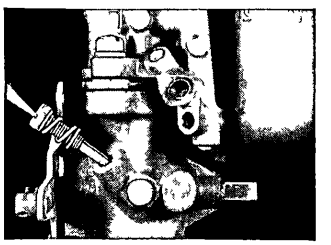
Remove low speed jet plug and gasket assembly, and low speed jet.



7.

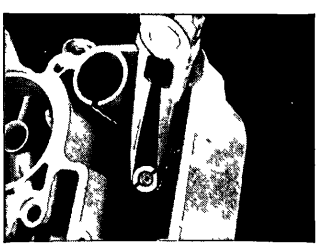
Remove idle well plug and gasket assembly, and idle well jet.

8.



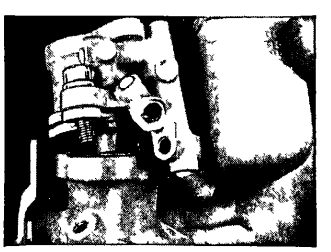
Remove nozzle passage plug and gasket assembly, nozzle retainer plug and nozzle.

Be sure to remove small nozzle gasket



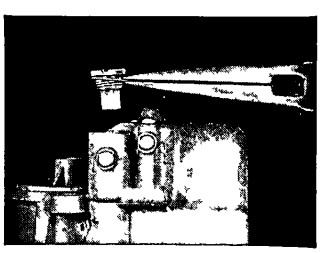
9.

Remove idle adjusting screw and spring.



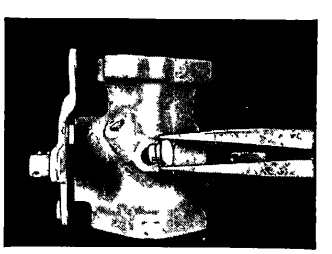
10.

Remove metering rod jet and gasket assembly.



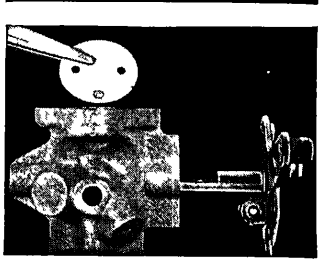
11.

Disassemble flange from body and remove insulator and gaskets.



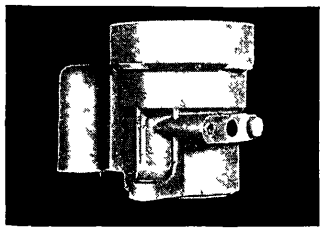
12.

Remove strainer passage plug, strainer, intake and discharge check assemblies.



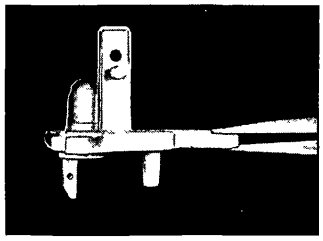
13.

Remove idle port rivet plug.



14.

Remove throttle valve screws, valve and throttle shaft and lever assembly.



Copyright 1939
Copyright 1948
by Carter Carburetor Corporation

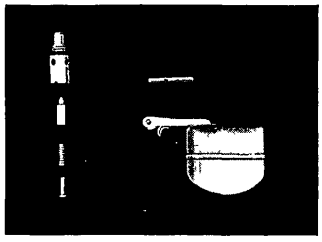
PRINTED IN U.S.A.

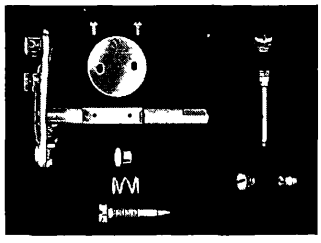
15.



Remove all parts from air horn and dust cover assembly.

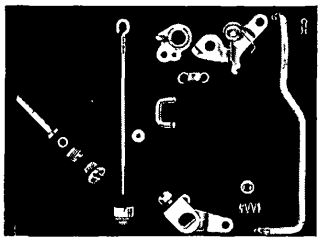
16.

Disassemble all parts from bowl cover.



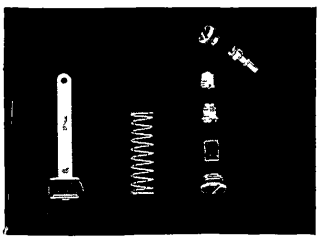
Clean all castings thoroughly, inside and out, with a small brush and clean gasoline Then blow out all passages with compressed air

TO REASSEMBLE



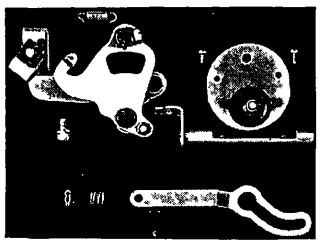
17.

Group all parts controlling gasoline level.



18.

Group all idle circuit parts.



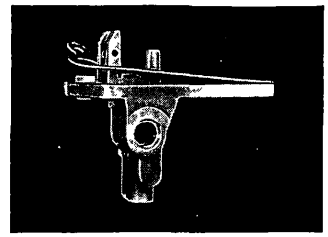
19.

Group all high speed circuit parts.

20.

Group all pump circuit parts.

21.

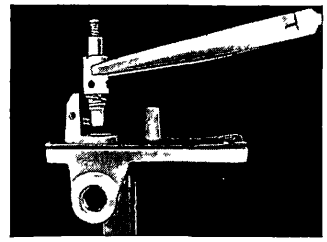


Group all choke circuit parts.

(See note at bottom of page)

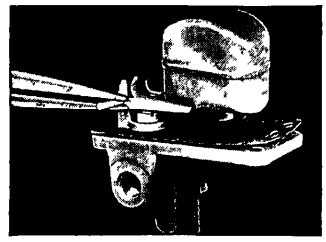
22.

Install bowl cover gasket.



Check bowl cover for warpage and wear on countershaft pin

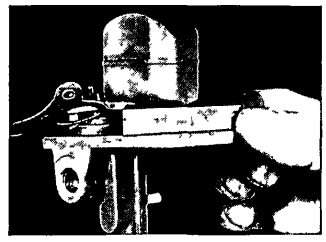
23.



Install needle seat and gasket assembly in bowl cover.

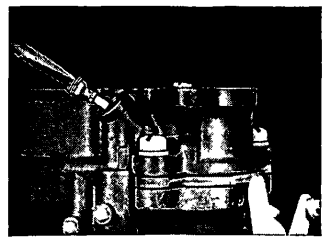
Then install needle pin and spring

24.



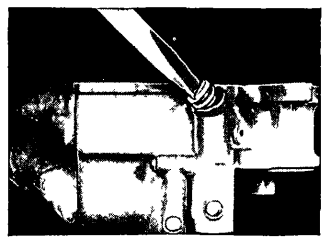
Install float and lever assembly and float pin.

25



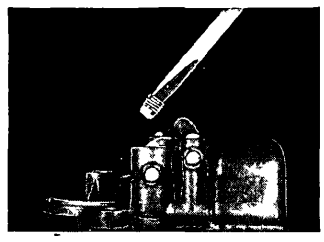
Set float level.

Turn gasket around so gauge can be placed on machined surface of casting Adjustment is obtained by bending float lip (which contacts needle). Do not bend float



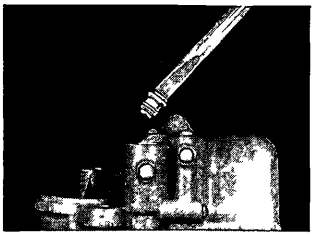
26.

Install pump jet.



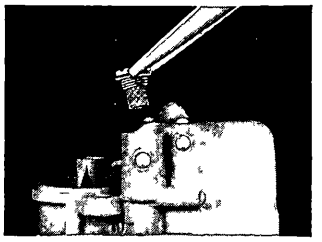
27.

Install pump jet passage plug and gasket assembly.

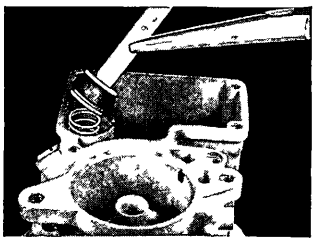


28.

Install discharge check assembly.

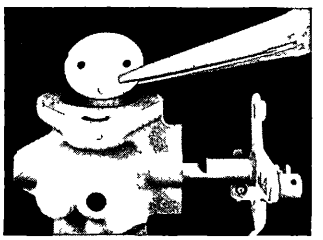


NOTE· Examine each part in each group and replace those parts that show wear or damage If any carbon is in the bore of the flange, remove it by scraping or with sandpaper (do not use emery cloth) Install all parts tight. Use all new gaskets



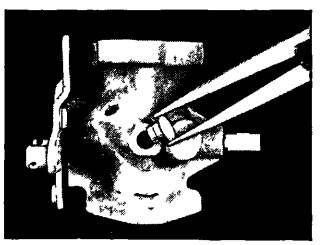
29.

Install intak check assembly.



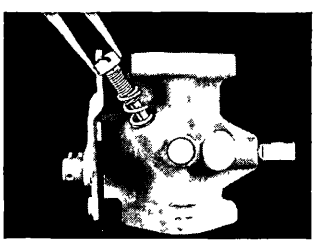
30.

Insert strainer in recessed portion of strainer plug. Then install strainer plug as assembled.



31.

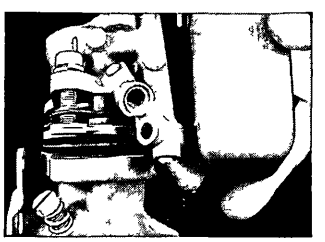
Install pump spring and pump plunger and rod assembly.



32.

Install throttle shaft and lever assembly and throttle valve. Install valve with small "c" toward idle port opening and facing manifold side of flange. Back out throttle lever adjusting screw. With screws loose, tap throttle valve lightly to centralize it in bore of carbureter, hold in place with fingers and securely tighten screws. Always use new screws

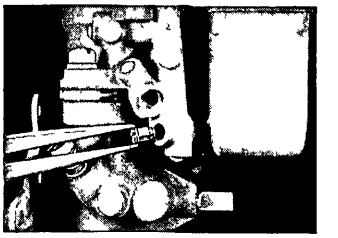
33.



Install new idle port plug.

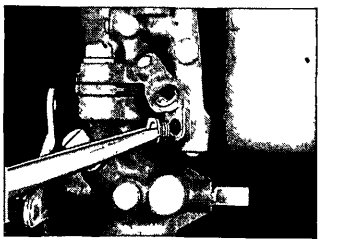
34.

Install idle adjustment screw and spring.



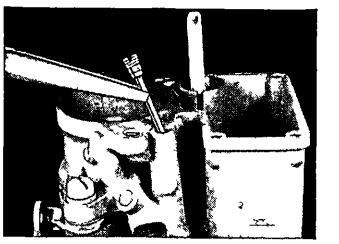
Set to specification

35



Assemble flange to body.

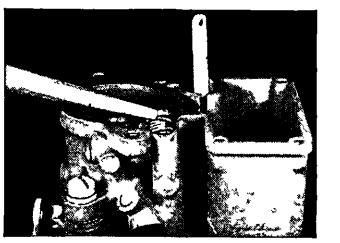
Use new gaskets Line up holes in body casting with holes in insulator, gaskets and flange before tightening screws Don t forget lock washers



36.

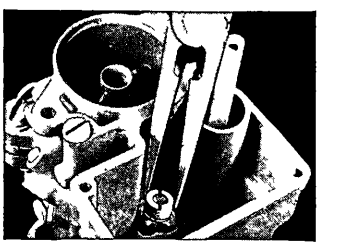
Install idl w ll j t.

37.



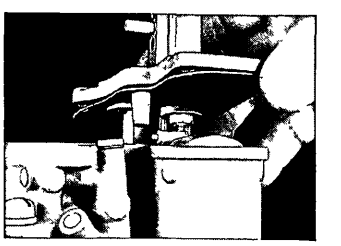
Install idle well jet passage plug and gasket assembly.

38.



Install low speed jet.

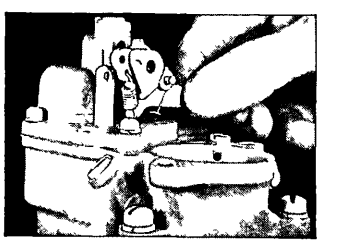
Work jet well into seat to insure a good seal.



39.

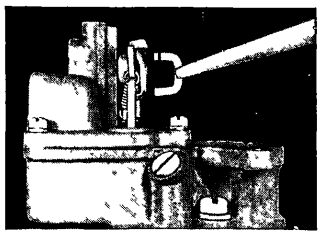
Install low speed jet passage plug and gasket assembly.

40.



Install metering rod jet and gasket assembly.

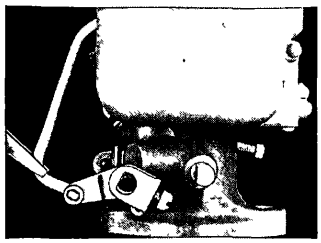
41.



Install bowl cover as assembled.

Tighten screws evenly and securely.

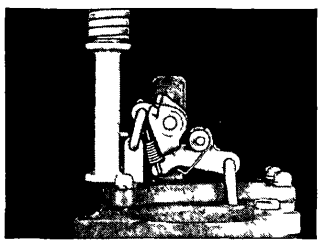
42.



Install pump arm and collar and pump operating lever assembly on pin in bowl cover.

43.

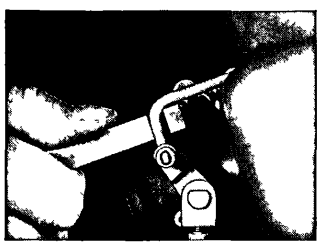
Install pump connector link.



Ends of link should be away from bore with pin spring at top.

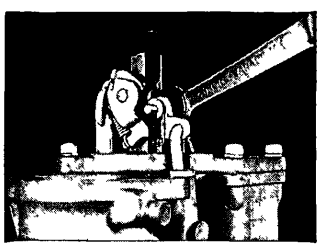
44.

Install throttle shaft arm and screw assembly on throttle shaft.



Then install throttle connector rod using new spring and retainer at lower end and pin spring at top end. Examine throttle connector rod and throttle shaft arm for wear.

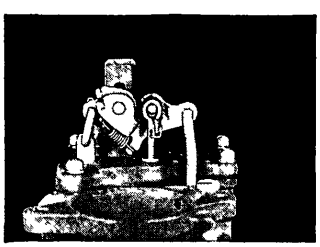
45.



Adjust pump stroke.

(See note at bottom of right hand column.)

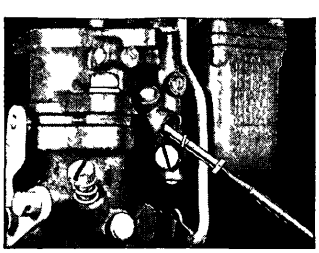
46.



Proper method of bending throttle connector rod for pump adjustment.

47.

Adjust metering rod.

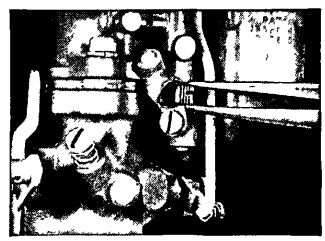


(See note at bottom of right hand column.)

48.

Remove metering rod gauge and install metering rod and disk.

End of metering rod spring should be inserted **through** hole in metering rod in 539S carbureter.

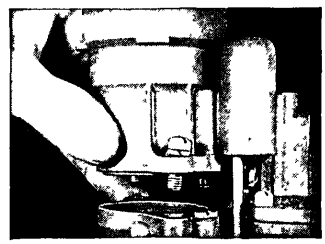


49.

Install nozzle and gasket.

Install nozzle with flat side facing up. Be sure to install new nozzle gasket.

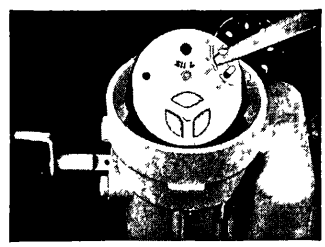
50.



Install nozzle retainer plug and nozzle passage plug and gasket assembly.

51.

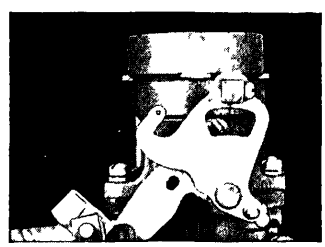
Install air horn and dust cover assembly on body.



Tighten screws evenly and securely.

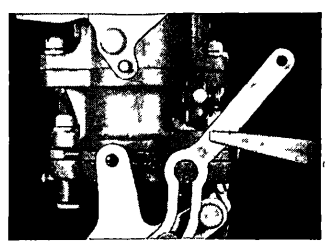
52.

Install choke shaft and lever assembly and choke valve.



Centralize valve in air horn, then securely tighten screws. Always use new screws.

53.



Install choke tube bracket assembly.

Connect choke pull back spring.

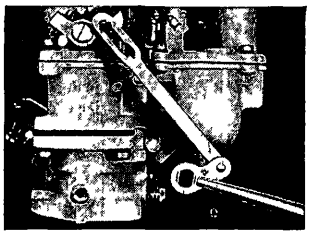
54.

Install choke connector link, spring and pin spring.

PUMP ADJUSTMENT: Back out throttle lever set screw. Pump plunger should travel specified distance from closed to wide open position. Pump travel can be measured by placing base of gauge T109-117S on raised portion of bowl cover so that projecting ear of gauge rests on top surface of pump shaft. Hold gauge vertical. The difference between the numbers shown by index mark on gauge at closed and wide open throttle positions will be plunger travel in 64th's. Adjust by bending throttle connector rod at lower angle (Fig. 46).

METERING ROD ADJUSTMENT: Insert gauge in place of metering rod, seating tapered end in metering rod jet. **With throttle valve seated** (back out throttle lever set screw) and metering rod pin resting on shoulder of gauge, tighten adjusting nut (Fig. 47). Remove gauge and install metering rod and disc. Connect metering rod spring.

ALWAYS USE ALL NEW GASKETS WHEN SERVICING A CARTER CARBURETER.



NO CARBURETER CAN DELIVER GOOD MILEAGE OR PERFORMANCE UNLESS COMPRESSION IS NORMAL AND THE MOTOR IS PROPERLY TUNED.

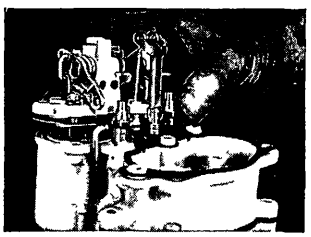
SERVICE PROCEDURE
1939 AND LATER WDO DUAL CLIMATIC® CONTROL
CARBURETER WITH VACUUM OPERATED METERING ROD AND CARTER STARTER SWITCH

Use Carter tool kit.

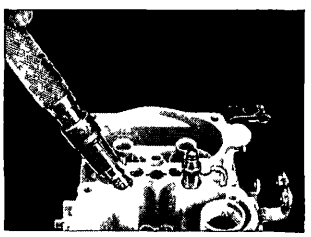
1.



Remove throttle shaft arm and screw assembly and fast idle connector link.

2.

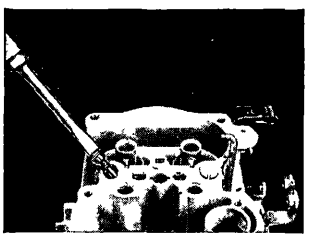
Remove air horn with all parts attached.



Attaching screw in air horn beneath choke valve must be removed

3.

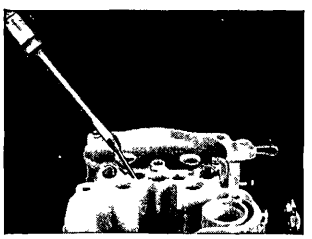
Disconnect throttle connector rod at upper end and remove bowl cover, with vacuum piston and link assembly and all attached parts.



Remove bowl cover gasket and vacuum piston spring

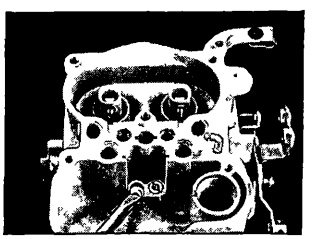
4.

Remove both anti-percolator valve assemblies.



(Omit when servicing Buick 440S)

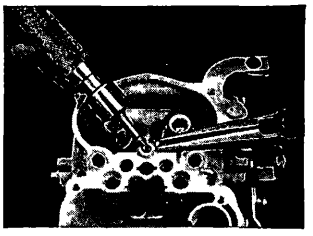
5.



Remove both pump jet plugs and pump jets.

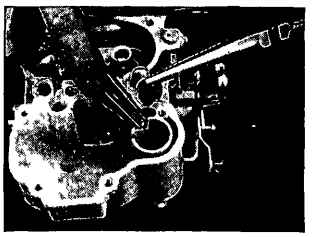
All metering jets in dual carbureters are in duplicate Illustrations shows removal of only one

6.



★Remove both by-pass bleeder plugs and low speed jets.

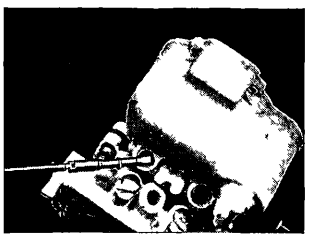
7.



Remove both metering rod jet and gasket assemblies.

Copyright 1939
Copyright 1949
by Carter Carburetor Corporation
All Rights Reserved

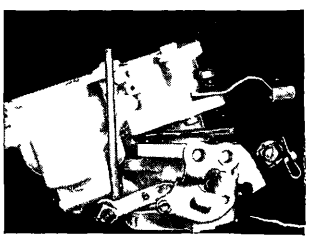
8.



Remove pump discharge ball retainer plug and check ball.

9.

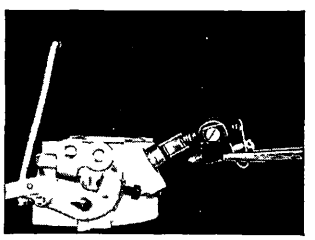
Remove pump strainer, pump check ball retainer ring and check ball.



(Use tool No T109-56)

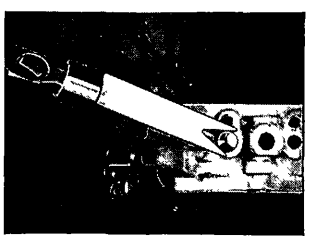
10.

Remove nozzle passage plugs, nozzle retainer plugs and nozzles.



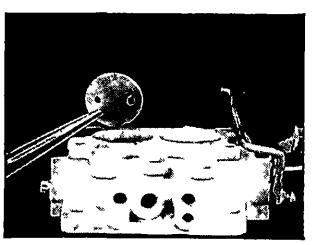
See that small nozzle gaskets are removed from casting

11.



Separate body flange assembly from body.

Remove body flange gasket.

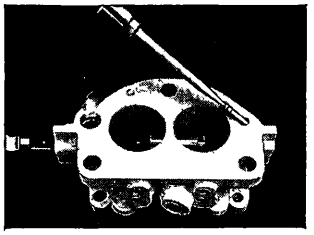


12.

Loosen terminal cap attaching screw and remove entire switch assembly from body casting.

13.

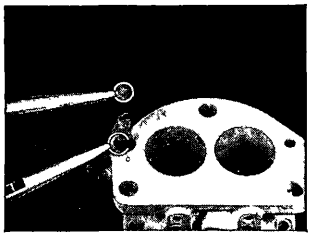
Remove idle adjustment screws and springs and idle port plugs.



14.

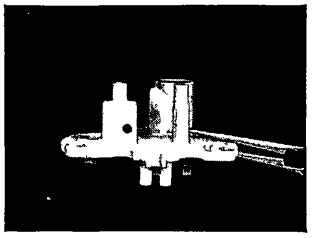
Remove throttle valve screws and throttle valves.

PRINTED IN U.S.A.



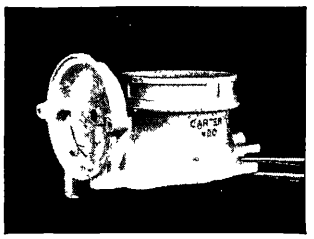
★Some carbureters have low speed tubes pressed in place and must not be removed

15.



R mov throttl cent ring scr w, th n thr ttle shaft and lever assembly.*

Check shaft for wear, loose lever and throttle rod holes in lever for wear

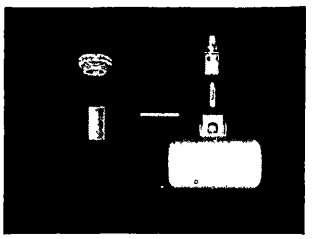


16.

Remove switch strainer retainer ring and strainer.

17.

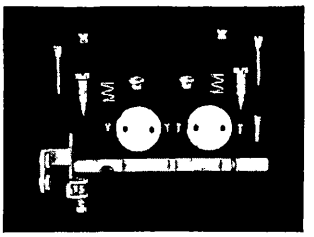
Remove all parts from bowl cover.



18.

Remove all parts from air horn and piston housing.

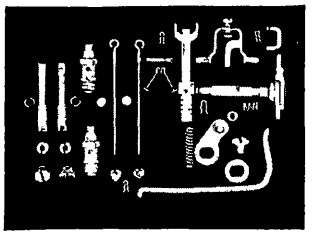
(See note at bottom of page)



TO REASSEMBLE

19.

Group all parts controlling gasoline level.



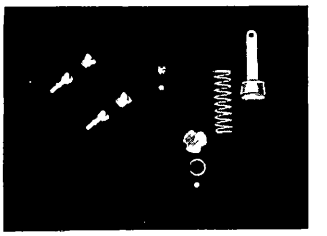
No. 1 Float circuit

20.

Group all parts controlling idle operation.

No. 2 Low speed circuit

21.

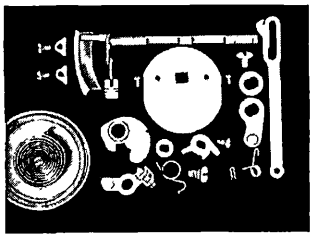


Group all parts controlling high speed operation.

No 3 High speed circuit

22.

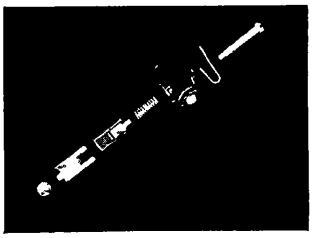
Group all parts controlling pump operation.



No 4 Pump circuit.

23.

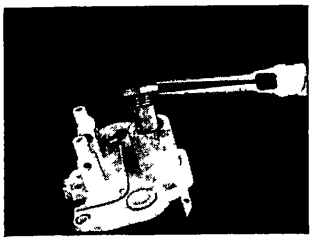
Group all parts controlling choke operation.



No 5 Choke circuit.

24.

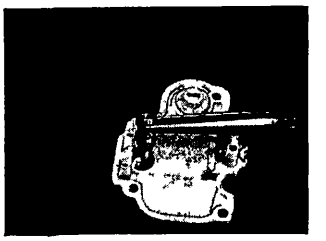
Group all parts controlling car starter switch.



Examine each part in all the groups and replace any part that shows wear or does not meet specifications

25.

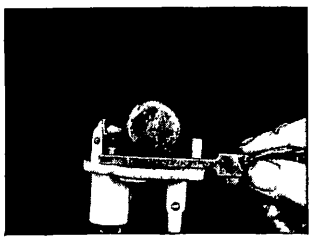
Install bowl cover strainer gauze, strainer nut and gasket assembly.



Use new gasket

26.

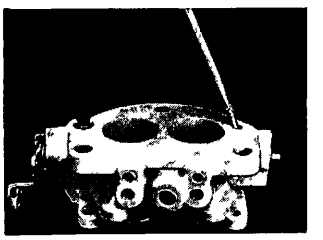
Install needle seat and gasket assembly.



Use new gasket

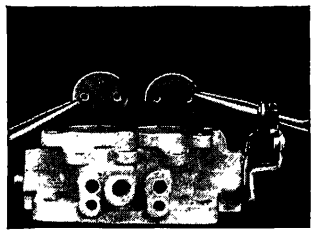
27.

Install needle, float pin and float and lever assembly.



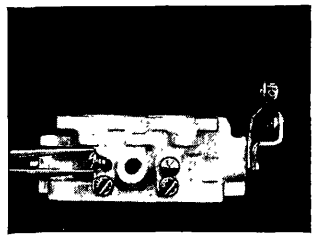
Check float for dents and wear on lip and float pin for wear Check bowl cover for warpage and wear in countershaft hole If needle shows groove on seating surface, replace both needle and seat. Set float level by gauging at both ends of float Adjust by bending float lip—**not float.**

28.



Install throttle shaft and lever assembly, loose throttle lever and throttle centering screw.*

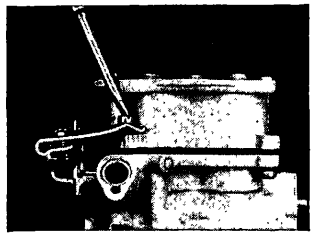
Back out throttle lever adjusting screw



NOTE: Clean casting and all parts thoroughly (except cork pieces), with clean gasoline. Clean throttle bores with sandpaper and gasoline Paint outside of body casting with Carter Special Body Finish. Do not restrict passages when painting All relief passages to outside must be clean.

*Late models use throttle centering washer—refer to specification page for installation instructions

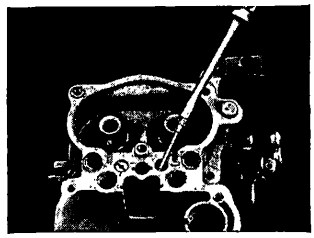
29.



Install thr ttl valv .
Small "c" in circle (or part number) should be toward idle port when viewing casting from manifold side. Center throttle valves by tapping lightly and hold in place with fingers b e f o r e tightening screws. A l w a y s use new screws.

30.

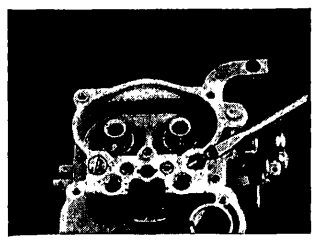
Install idle port plugs, then idle adjustment screws and springs.



Set idle adjusting screws to specifications.

31.

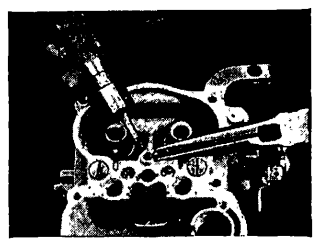
Install body on body flange assembly.



Use new gasket. Be sure tube clamp assembly is in place.

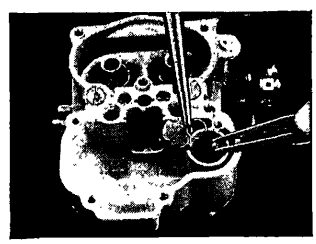
32.

★Install low speed jet and by-pass bleeder plugs.



Jets must seat in casting.

33.



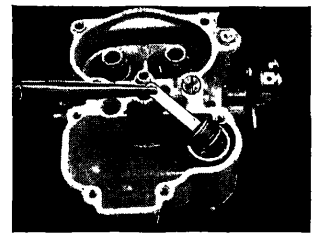
Install pump jets and pump jet plugs.

Make certain jets are clear of all restriction and seat properly. No washers are used beneath plugs. Check to see that outside bleed hole in casting is not restricted.

34.

Install check ball and pump discharge ball retainer plug.

35.

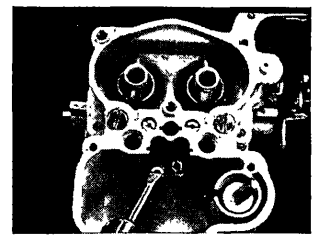


Install intake c h e c k ball, pump check ball retainer ring and pump strainer.

(Use tool No. T109-122U.)

36.

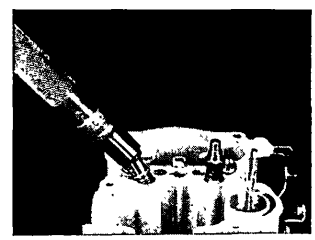
Install pump spring and pump plunger and rod assembly.



Replace entire plunger assembly if leather shows wear or mutilation. No pump loading cylinder is necessary.

37.

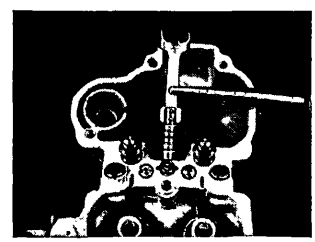
Install metering rod jet and gasket assemblies.



Metering rod jets must be installed snugly, but not so tightly as to cause distortion.

38.

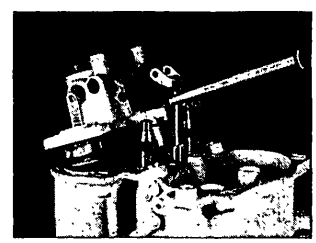
Install anti-percolator valves.



No gaskets are used. (Omit when servicing Buick 440S.)

39.

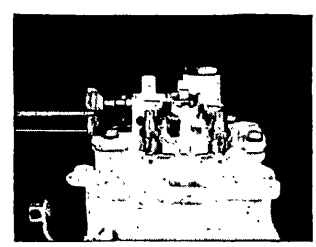
Install vacuum piston spring and vacuum piston and link assembly.



It is usually advisable to replace vacuum piston spring each time carbureter is serviced.

40.

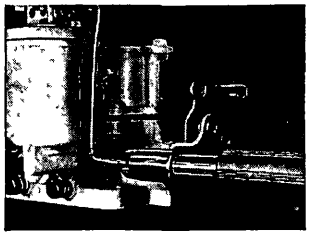
Raise vacuum piston and link assembly and install b o w l cover with parts attached.



Use new bowl cover gasket.

41.

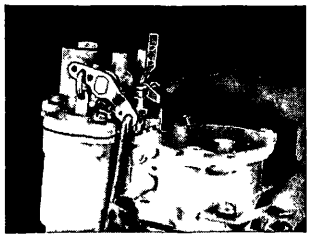
Install anti-percolator arm and screw assembly, pump operating lever and countershaft assembly and pump arm and collar assembly.



Install pump link in proper hole in pump arm.

42.

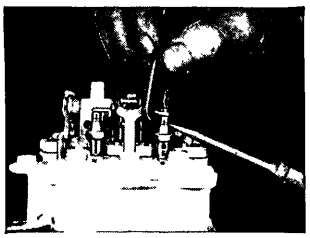
Install throttle connector rod. Gauge pump stroke.



Check throttle connector rod for w ar on both nds. (To check pump stroke, see note on page 4.)

43.

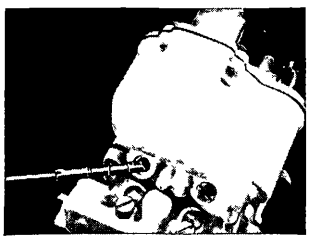
Bend throttle connector rod as shown for pump stroke adjustment.



Use tool T109-75.

44.

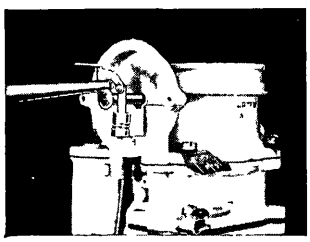
Adjust metering rods.



(See note below.)

45.

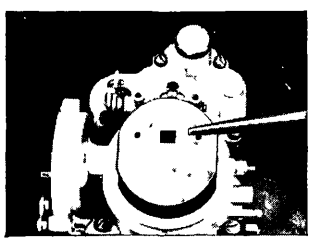
Adjust anti-percolator valves.



See Specification Sheet for adjustment.

46.

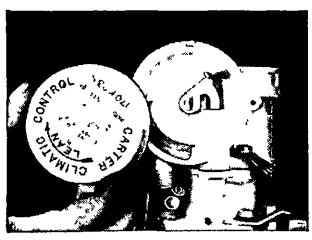
Install nozzles, nozzle retainer plugs and nozzle passage plugs.



Install with flat side of nozzle up. Use new gaskets.

47.

Install air horn and piston housing on body. Then install choke piston lever, link and shaft assembly.



Use new air horn gasket.

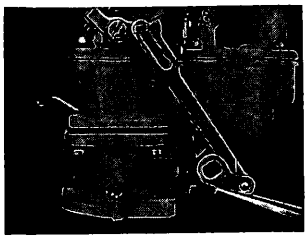
48.

Install choke valve.

Use new screws. Seat choke valve by tapping lightly and hold in place with finger before tightening screws. Valve or shaft must not bind in any position.

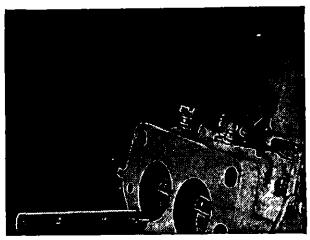
49.

Install piston housing strainer and thermostatic coil and housing assembly.



Install housing with indicator mark at bottom. Revolve housing counter clockwise and set index mark as stated in specification sheet, then tighten attaching screws.

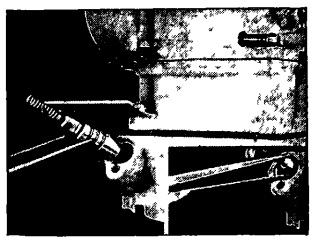
50.



Install fast idle cam, washer and choke trip lever on choke shaft.

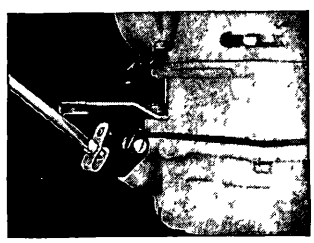
Then install fast idle arm, pin and screw assembly and fast idle arm spring.

51.



Install fast idle connector link, throttle shaft arm and pin assembly, washer and spring.

52.



Adjust fast idle.

Hold choke valve tightly closed and adjust fast idle arm screw to give specified clearance between edge of throttle valve and bore of carbureter, side opposite port.

53.

Install switch strainer and retainer ring (See Fig. 16). Then switch ball, switch plunger, guide block, contact spring and return spring.

54.

Install terminal cap assembly, hold down clip and terminal cap attaching screw.

Use tool T109-155S to qualify switch.

PUMP ADJUSTMENT: With pump connector link in proper hole in pump arm, throttle adjustment screw backed out, pump plunger should travel specified distance from closed to wide open position. Adjustment can be made by bending throttle connector rod at lower angle as shown on Fig. 43. (Use tool T109-75.) Travel can be measured with tool T109-117S. Indicator ear of gauge should be placed on top surface of connector link at pump shaft.

METERING ROD ADJUSTMENT: Back out throttle lever adjusting screw so that throttle valves seat, insert metering rod pin in vacuum piston shaft and then insert metering rod gauge in place of metering rod, making sure that gauge seats in metering rod jet. Depress vacuum piston shaft lightly until contact is made with tongue on anti-percolator arm, using tool No. T109-105, bend tongue on anti-percolator arm until there is less than .005" clearance between metering rod pin and shoulder of notch in gauge. (See Fig. 44.) Remove gauge and install metering rods, discs and metering rod spring. Use pin spring on metering rod pin.

Always use complete new gasket assortment when servicing a Carter Carbureter.

NO CARBURETER CAN DELIVER GOOD MILEAGE OR PERFORMANCE UNLESS COMPRESSION IS NORMAL AND THE MOTOR IS PROPERLY TUNED

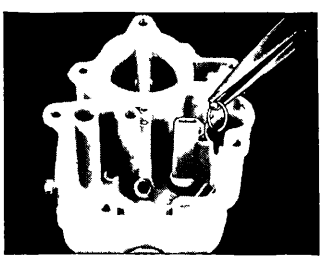
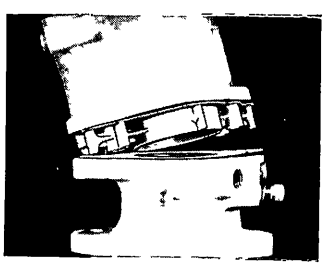
Remove pump check plug and discharge check ball.



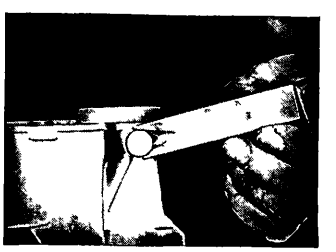
9.

Remove main metering jet and gasket assembly.



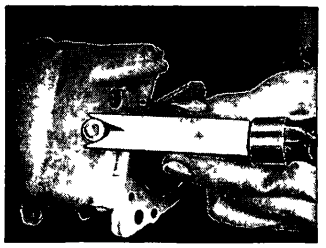
10.

Remove pump retainer ring and intake check ball.



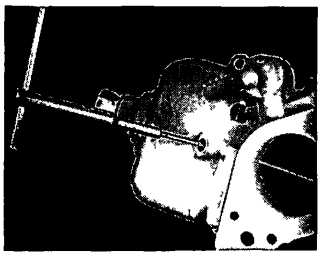
11.

Remove body flange assembly and insulator from body.

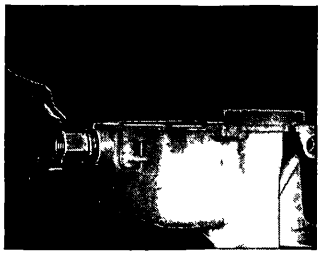


12.

Remove pump j t rivet plug and pump j t.



PRINTED IN U.S.A.

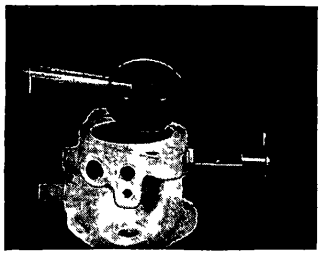


13.

R move main vent tube rivet plug.

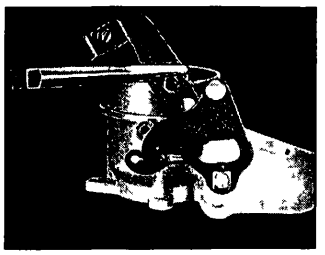
14.

Remove main vent tube.
Use tool T109-195.



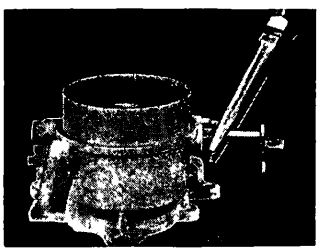
15.

Remove needle seat and gasket.



16.

Remove idle adjustment screw and spring, then idle port rivet plug.



17.

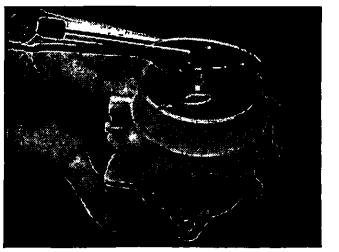
Remove throttle valve and throttle shaft and arm assembly.

18.

Remove choke tube bracket assembly.

19.

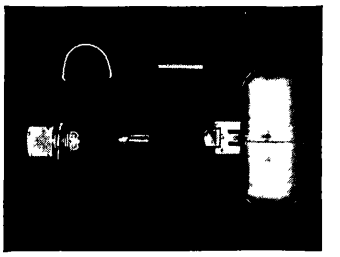
Remove choke valve screws and ch ke shaft and lever assembly.



Check for wear and loose l ver on shaft.

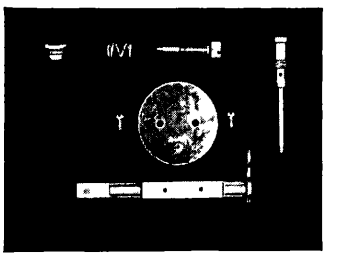
20.

R m ve choke valve.



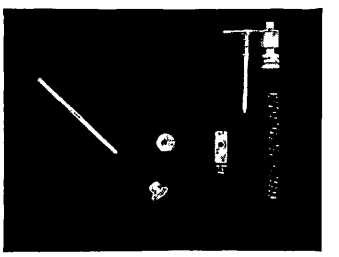
Clean castings and all parts thoroughly with solvent or any good carbureter cleaner. Scrape all carbon from bore of casting.

TO REASSEMBLE



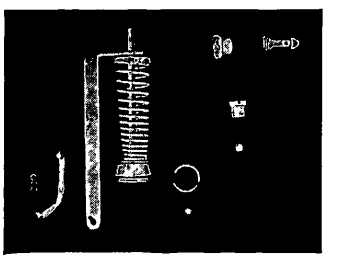
21.

Group parts controlling gasoline level.



22.

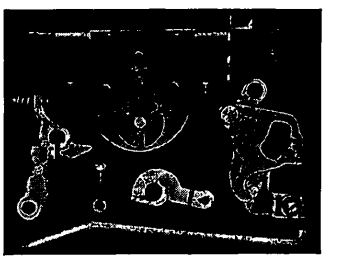
Group parts controlling idle circuit.



23.

Group parts controlling high speed circuit.

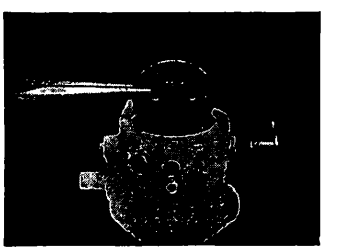
24.



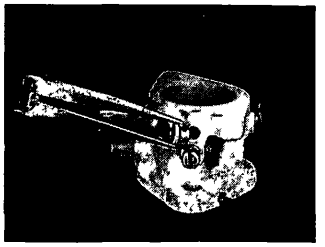
Group parts controlling pump circuit.

25.

Group parts controlling choke circuit.



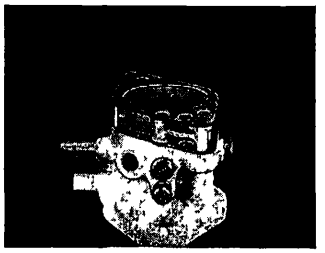
Examine each part in the five groups and replace any part that shows wear, or does not meet specifications.



26.

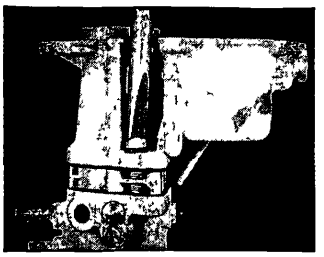
With manifold side of flange d wn, install thr ttl shaft and arm assembly, th n thr ttl valv .

Small "c" in circle should be toward idl port, and facing downward. C nter valv by tapping lightly and hold in plac b for tight ning scr ws. Use n w scr ws.



27.

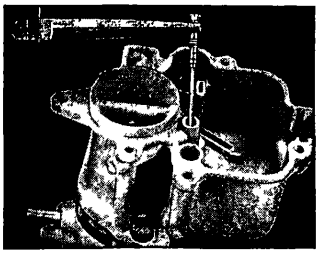
Install new idl port rivet plug first, th n install idl adjustment screw and spring.



Back out seated screws to specifications

28.

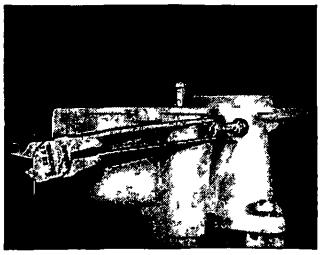
Install insulator and gaskets.



Use new gaskets Be sure that holes in casting, insulator and gaskets line up properly.

29.

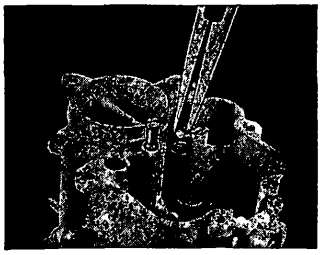
Install body castings and securely tighten screws.



Don't forget lock washers

30.

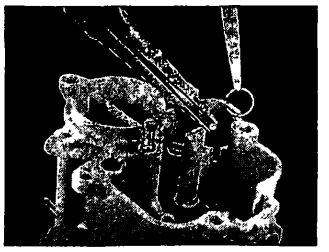
Install idle orifice tube.



Do not tighten—leave it loose

31.

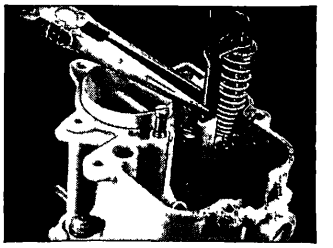
Install pu- jet and pump jet rivet plug.



Be sure jet ' clear of all restrictions an its pr perly.

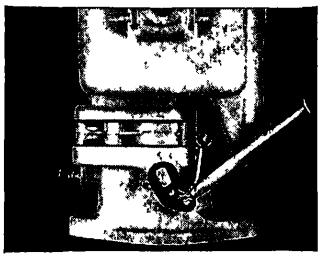
32.

Install pump discharge ball and plug



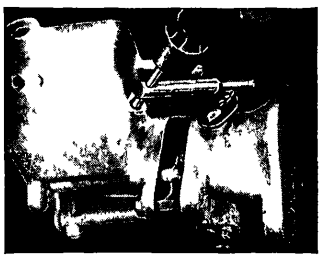
Discharge all is large ball Be sur put check balls in correct passages

33.



Install pump intak check ball and pump r tain r.

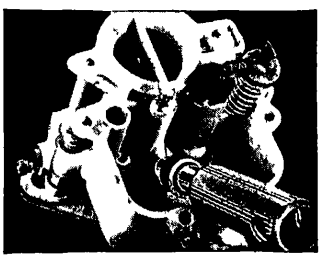
Intake ball is small.



34.

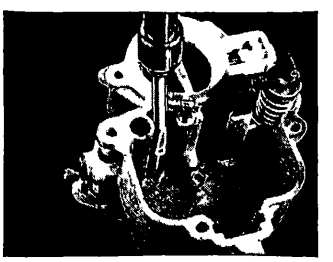
Install pump plunger and r d ass mbly, pump spring and pump lifter link.

35.



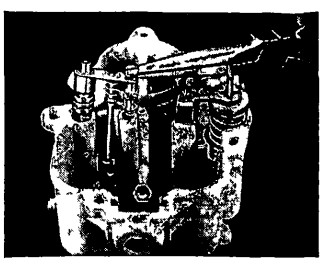
Install pump connector link and pin spring. Connect in center hole.

36.



Install main vent tube, then main vent tube rivet plug.

Tools T109-70 or T109-151 must be used to install new tube (See "Adjustments" on catalog page) Never reuse an old vent tube or plug.



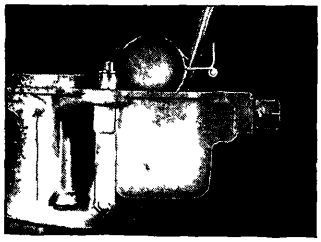
37.

Install main metering jet and gasket assembly.

38.

Install step-up jet and gasket assembly.

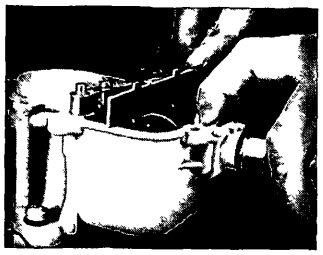
ll step-up piston gasket, pring and step-up piston, plate and rod assembly. Secur ly tighten idle orifice tube.



Check springs for damage.

40.

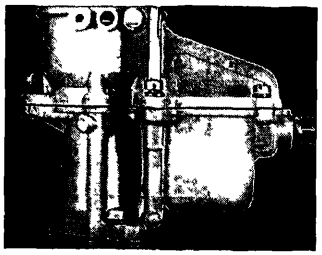
Install needle seat and gask t.



Then install needl . If n dl or seat shows wear, replac both parts.

41.

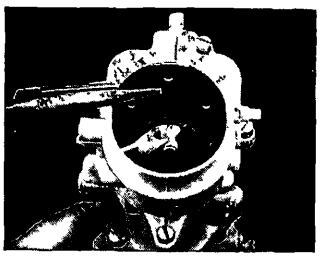
Install float and lever assembly, float pin and float lever pin retainer.



Check float for dents and for wear on float lip or float pin

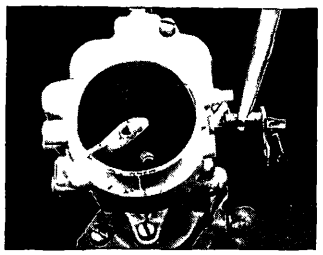
42.

Set float level.



Set float level to specifications Bend lip not float

43.



Install air horn assembly.

Use new gasket

44.

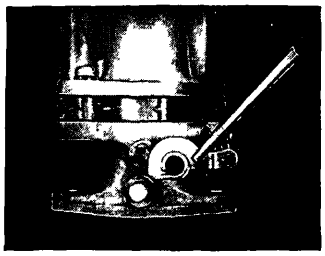
Install choke valve.

45.

Install choke shaft and lever assembly with spring attached.

Use new screws Center valve by tapping lightly before tightening screws

46.

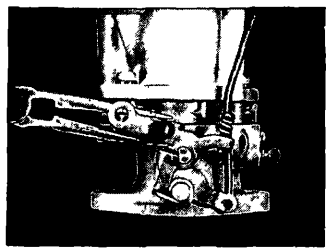


Install choke bracket assembly.

Attach spring

47.

Install fast idle rod and fast idle cam. Place cam on cast iron shaft.



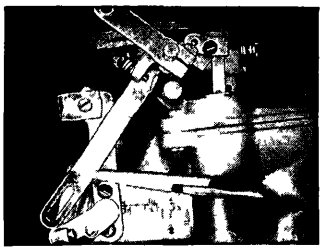
Check rod and cam for wear

48.

Install throttle lever assembly.

Tighten screws securely Protect your work with a Carter Airdome or Ceramic Filter

Note: New flange gasket should be used when Installing carbureter on manifold. On cars without governor, gasket with 4 slots should be used; on cars with governor, gasket with 4 small holes should be used between carbureter and governor, the original gasket with 4 slots to remain on manifold beneath governor.



Always use complete new gasket assortment when servicing a Carter Carbureter.

NO CARBURETER CAN DELIVER GOOD MILEAGE OR PERFORMANCE UNLESS COMPRESSION IS NORMAL AND THE MOTOR IS PROPERLY TUNED.

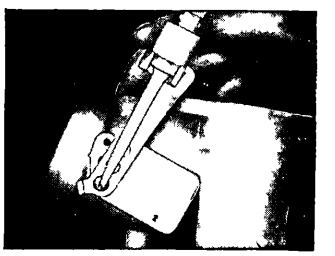
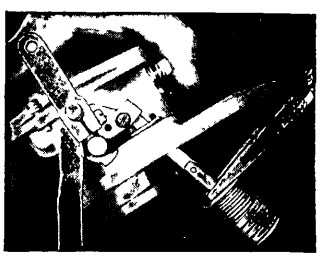
8.

Remove needle and seat assembly.



9.

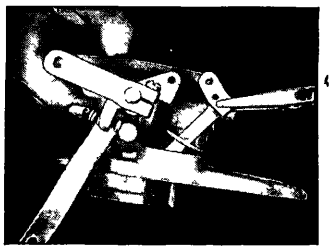
Remove main metering screw.



10.

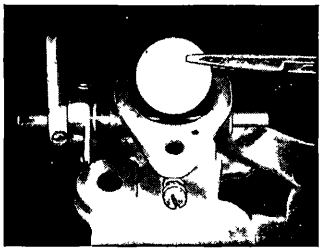
Remove choke valve assembly and choke shafts.

11.



Remove choke tube bracket assembly.

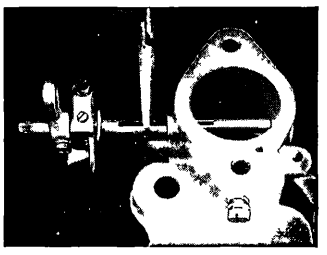
12.



Remove complete pump assembly.

PRINTED IN U.S.A.

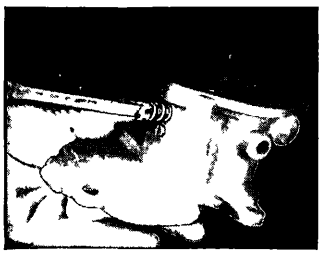
13.



R mov pump link and coverplate.

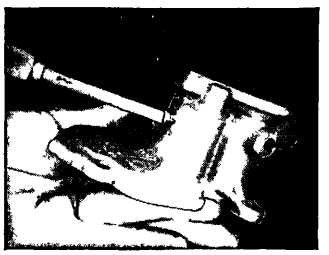
14.

Remove throttle valve.



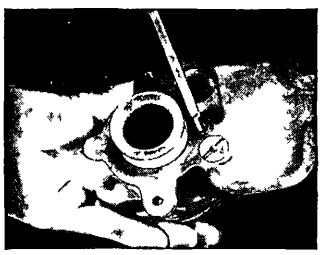
Then remove loose throttle lever and dog assembly from shaft

15.



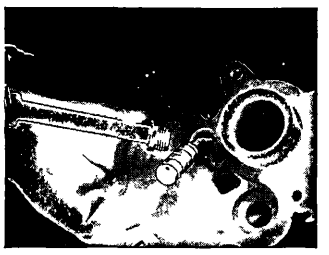
Remove throttle shaft with parts attached.

Remove choke link from shaft



16.

Remove idle adjustment screw and spring.

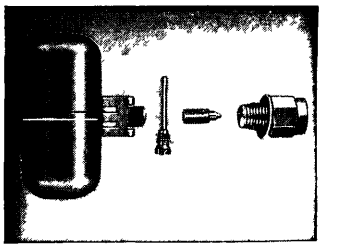


17.

Remove idle port plug.

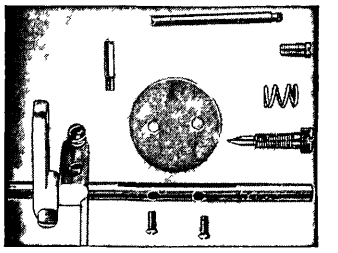
18.

Remove idle passage tube.



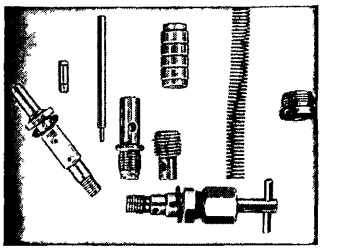
19.

Remove step-up piston plug to remove step-up piston and spring.



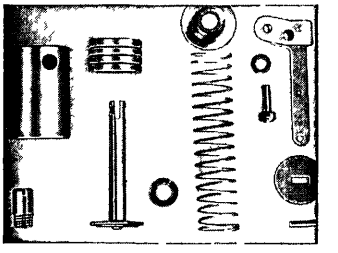
(See note at bottom of page)

TO REASSEMBLE



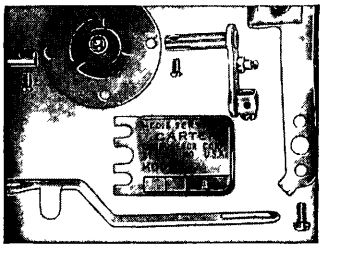
20.

Group parts controlling gasoline level.



21.

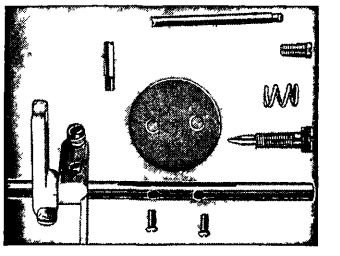
Group parts controlling idle circuit.



22.

Group parts controlling high speed circuit.

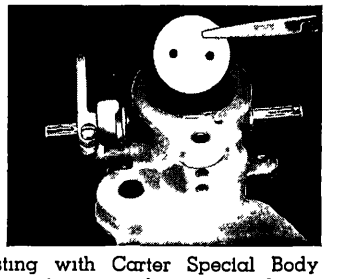
23.



Group parts for pump circuit.

24.

Group parts for choke circuit.

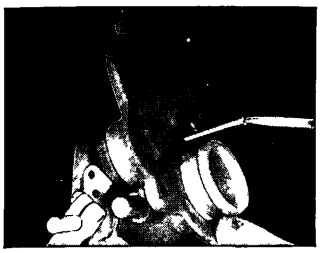


Examine each part in the five groups and replace any part that shows wear or does not meet specifications

25.

Assemble parts controlling idle circuit.

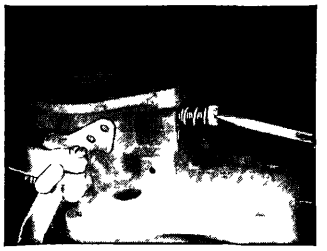
Install choke link on throttle shaft



26.

Install throttle shaft with assembled parts and throttle valve.

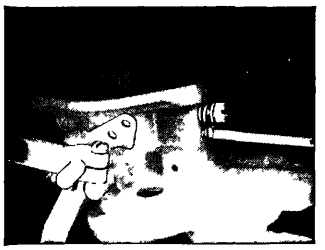
Small "c" in circle or part number should be toward idle port when viewing casting from manifold side. Center throttle valve by tapping lightly and hold in place with finger before tightening screws Always use new screws



Not : Clean casting and all parts thoroughly with clean gasoline Paint outside of body casting with Carter Special Body Finish Be sure Finish does not restrict passag s. Special precaution should b taken that there is no carbon accumulation in air bleed through venturi to idle passag .

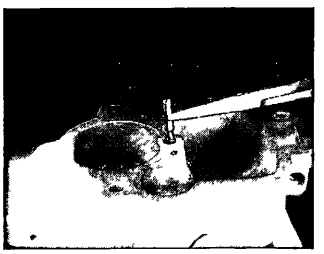
27.

Install idl passage tube.



If there is carbon accumulation on tube, replace with new tube. Do not install tube too tightly. A snug fit will suffice.

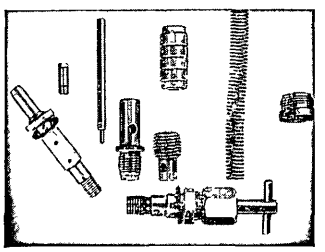
28.



Install idle adjustment screw and spring.

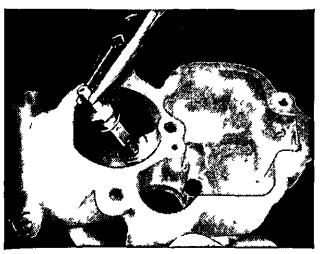
Set screw to specifications.

29.



Install idle port plug.

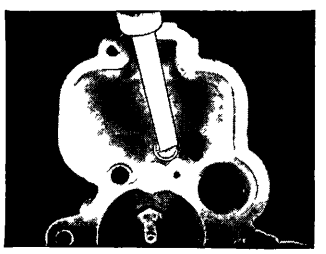
30.



Install idle orifice tube.

Do not install too tightly.

31.



Assemble parts controlling high speed circuit.

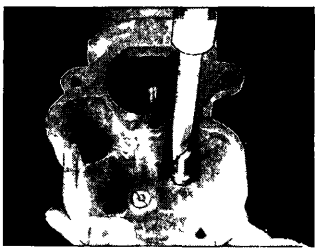
32.

Install nozzle.

All carbureters use one nozzle gasket except 289S which should have two.

33.

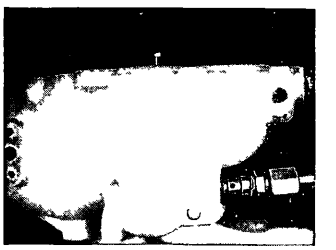
Install pump valve assembly.



See that ball in valve operates freely as all fuel to idle and high speed circuits is fed through this port. Lower face of valve must seat in casting.

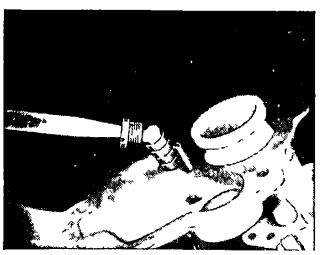
34.

Install new vent tube.



Use care when installing. Tube must be tight.

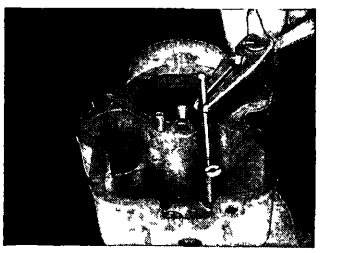
35.



Install step-up valve assembly.

No gasket is used under this valve.

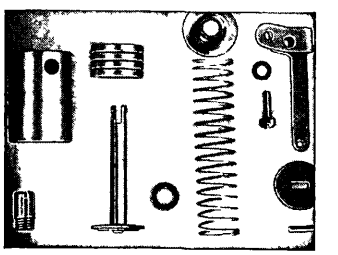
36.



Install main metering screw.

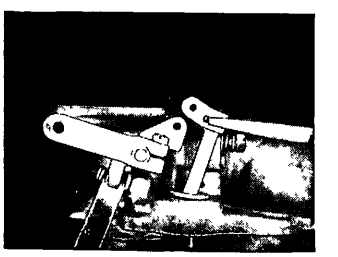
37.

Install step-up spring, piston and piston plug.



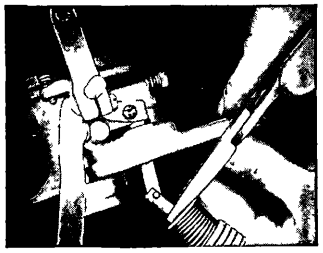
If piston shows slightest wear, replace. Always install new step-up piston spring.

38.



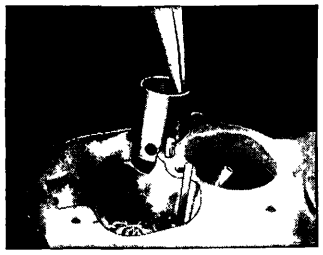
Install step-up push rod.

Small portion of pin must be down.



39.

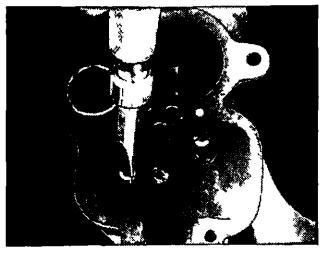
Assemble parts for pump circuit.



40.

Install pump link and coverplate.

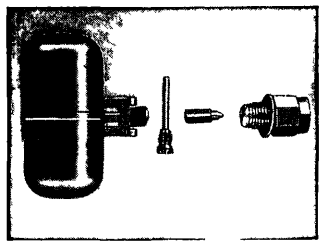
41.



Install compl t pump ass m-bly.

42.

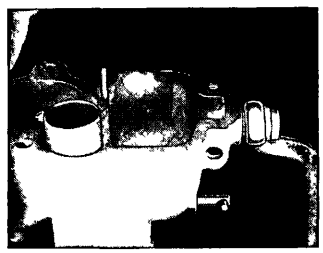
Install pump sleeve.



Install with holes toward bottom

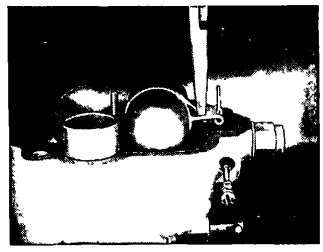
43.

Install check valve assembly.



Ball must be free

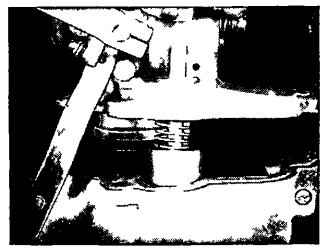
44.



Assemble parts that control gasoline level.

Check float for dents and wear on lip, and float pin for wear If float is loaded with gas, replace. If needle shows groove on seating sur face replace both needle and seat

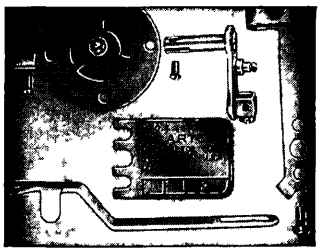
45.



Install needle and seat assembly.

46.

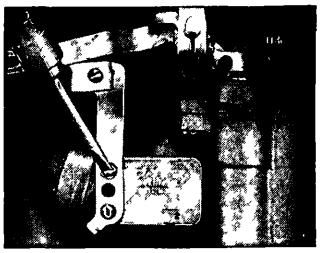
Install float and lever assembly and float pin and plug assembly.



Set float level to specifica tions by bending lip not float

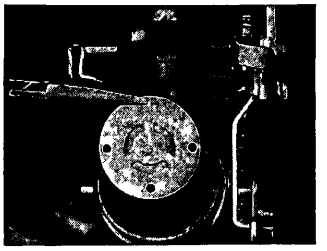
47.

Install upper casting as assembled.



Use new body gasket

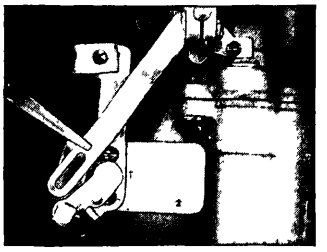
48.



Ass mbl parts for choke circuit.

Choke link has already been installed

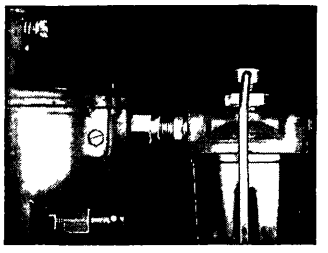
49.



Install choke tube bracket assembly and tag.

50.

Install choke shafts and choke valve assembly.



Assemble with valve in position as shown.

51.

Connect choke link.

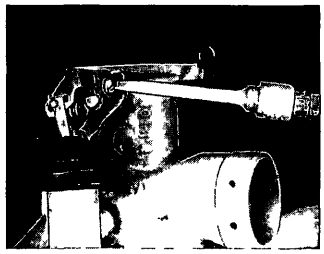
Be sure to use choke link washer.

52.

Protect your work with a Carter Airdome Fuel Filter.

Note: New flange gasket should be used when installing carbureter on manifold. On cars without governor, gasket with 4 slots should be used; on cars with governor, install 26-12 plug in hole in bore and use gasket with 4 small holes. The original gasket with 4 slots to remain between manifold and governor.

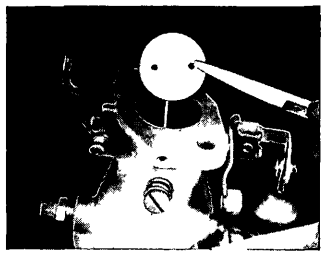
Always use complete new gasket assortment when servicing a Carter Carbureter.



NO CARBURETER CAN DELIVER GOOD MILEAGE OR PERFORMANCE UNLESS COMPRESSION IS NORMAL AND THE MOTOR IS PROPERLY TUNED.

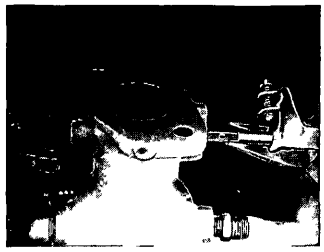
CARTER CARBURETOR
DIVISION OF acf INDUSTRIES INCORPORATED
ST LOUIS, MO, U S A

SERVICE PROCEDURE



BRASS BOWL UPDRAFT CARBURETER

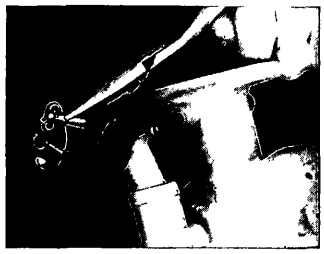
A fast, simple, Circuit method of servicing Carter Brass Bowl Carbureters. Use Carter Tool Kit. BE ACCURATE.



1.

Loosen pump arm assembly.

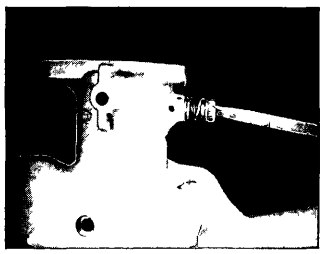
2.



Remove throttle valve, bracket and rod assembly.

3.

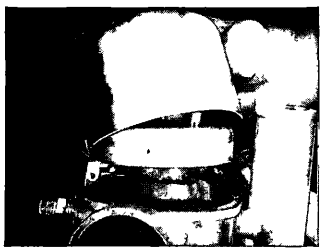
Remove throttle shaft and lever assembly.



Loose lever will drop free If throttle shaft is worn, or lever is loose on shaft, or if connector rod hole in lever is worn, replace

4.

Remove plunger and boot assemblies.



Disassemble all parts

5.

Remove idle adjustment screw and spring.

If seating surface is grooved or mutilated, replace

6.

Remove body and bowl nut assembly.

Remove gasket

Copyright © 1937
Copyright © 1948
by Carter Carburetor Corporation
All Rights Reserved

7.

Remove float lever pin, float and lever assembly and intake needle.

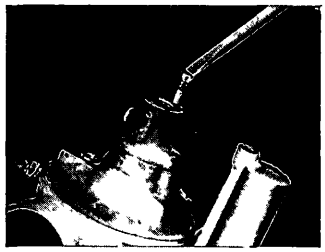
Check float for dents and wear on lip, and float pin for wear If float is loaded with gas, replace If needle shows groove on seating surface, replace both needle and seat

8.

Remove ball check housing assembly.

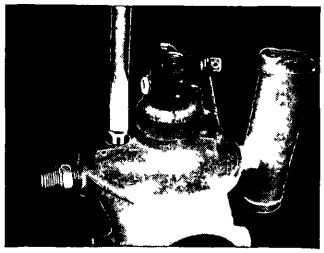
Check by blowing through assembly Ball must seat tight but move freely

9.



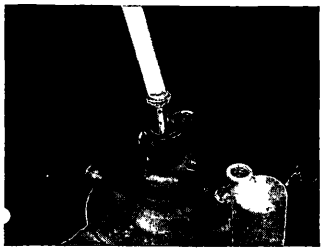
Remove pump cylinder plug

10.



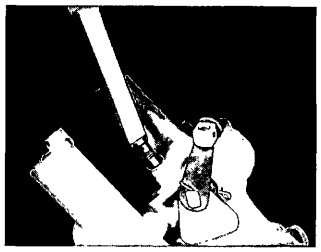
Remove low speed jet tube assembly.

Examine to see that tube has been seating at upper end If no seat mark shows, tapered seat in casting has been drilled out, and carbureter must be replaced



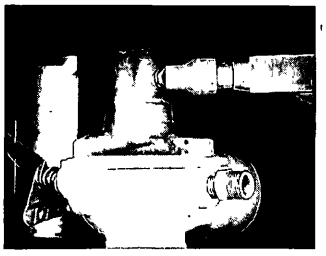
11.

Remove needle seat and gasket.



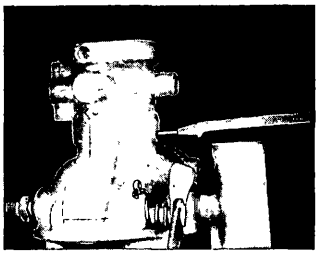
12.

Remove multiple jet nozzle.



PRINTED IN U.S.A.

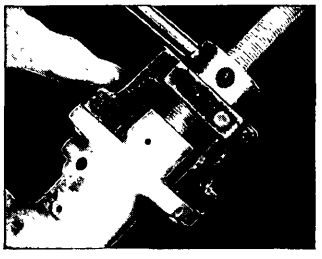
13.



Remove pump jet assembly.

Examine and see that jet seats at both ends.

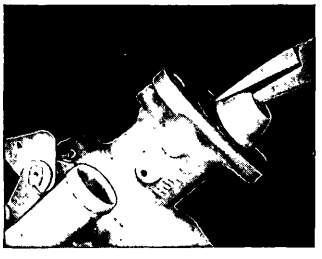
14.



Remove well jet assembly.

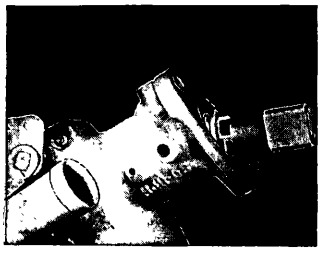
15.

Remove venturi pin.



(See note, bottom of page 4.)

16.



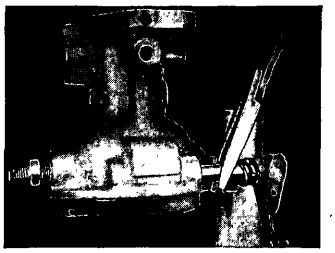
Remove venturi.

Illustration shows proper use of venturi puller.

17.

Remove venturi choke cone.

18.

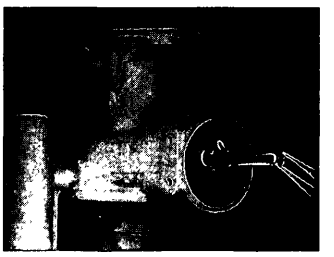


Remove stand pipe assembly.

When removing, be sure to hold choke lever in choke position to prevent injury to choke arm.

19.

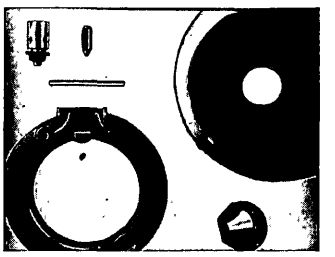
Remove choke shaft and l v r assembly.



Check for loose lever and wear on shaft.

20.

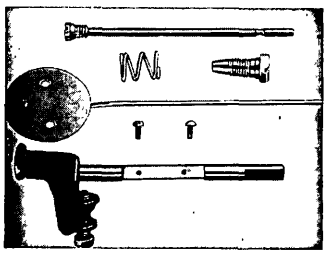
Remove venturi choke arm.



(See note at bottom of page)

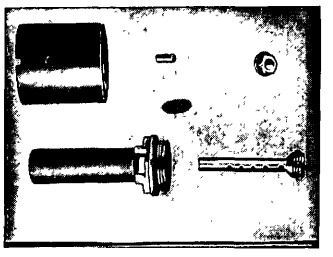
TO REASSEMBLE

21.



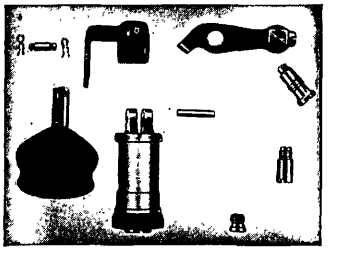
Group parts controlling gasoline level.

22.



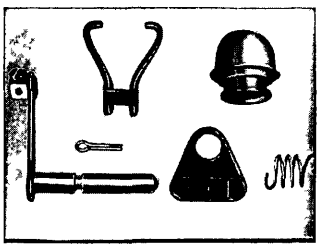
Group parts controlling idle circuit.

Check metering rod for wear. If worn, replace both rod and multiple jet nozzle.



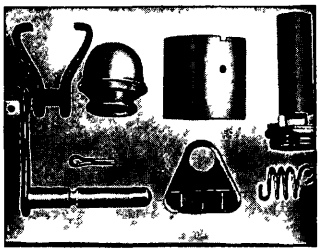
23.

Group parts controlling high speed circuit.



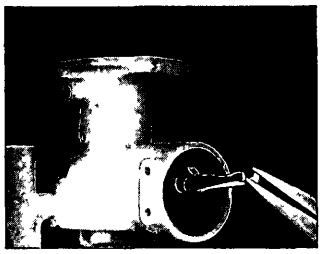
24.

Group parts for pump circuit.



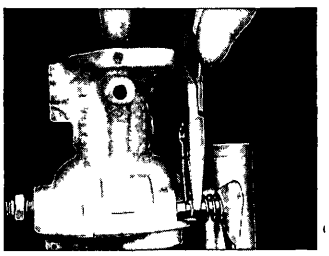
N t : Clean casting and all parts thoroughly with clean gasoline. Paint outside of body casting with Carter Special Body Finish. Be sur Finish does not restrict passag s.

25.



Group parts for chok circuit.

Examine each part in the five groups and replace any part that shows wear, or does not meet specifications



26.

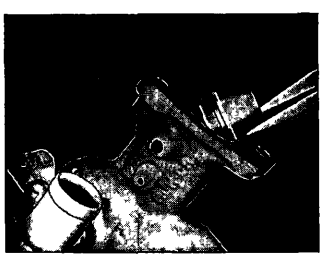
Remove venturi, venturi pin and stand pipe from the high speed group and place them with the choke group for assembly.

27.

Install venturi choke arm.

28.

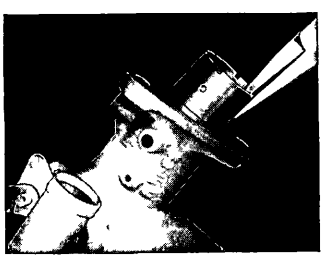
Install choke shaft and lever assembly.



Centralize choke arm on shaft after assembly.

29.

Install stand pipe assembly.



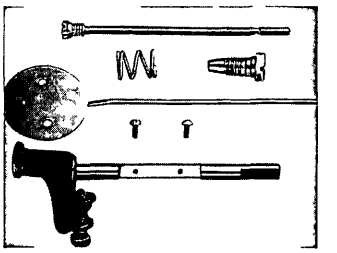
Hold choke lever in choke position while installing

30.

Install choke cone.

Be sure venturi choke arm fits freely into groove in choke cone.

31.

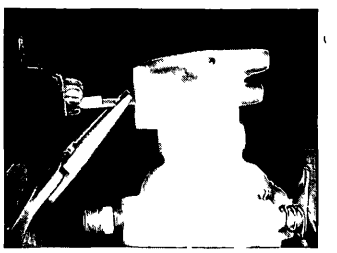


Install venturi.

Use new venturi pin.

32.

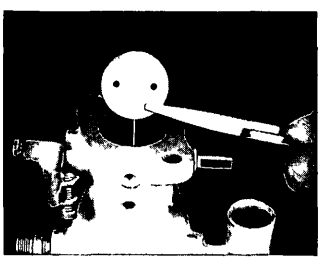
Assembl idl circuit parts as sh wn.



Never reinstall a used low speed jet Be sure to scrape all carbon from bore of casting

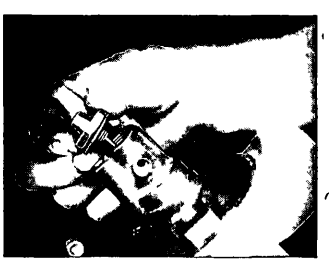
33.

Install throttle shaft and lever assembly.



Back out throttle lever adjusting screw.

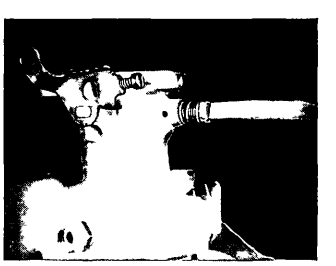
34.



Install throttle valve, bracket and rod assembly.

Small "c" in circle or part number should be toward idle port when viewing casting from manifold side Center throttle valve by tapping lightly and hold in place with finger before tightening screws Always use new screws

35.



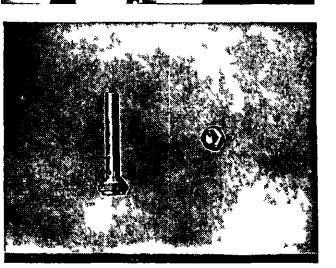
Install body and bowl nut assembly to protect metering rod.
This should be done before tightening screws in valve.

36.

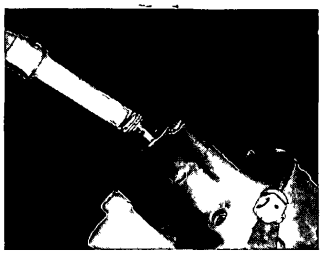
Install idle adjusting screw and spring.

Set idle adjusting screw to specifications

37.



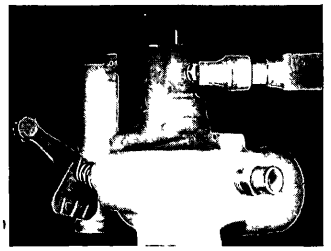
Install new low speed jet tube tightly.



38.

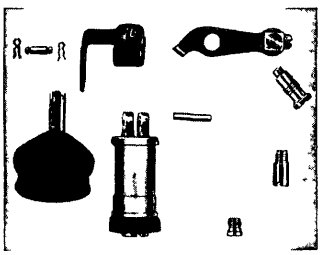
Assemble remainder of high speed circuit parts.

Remove body and bowl nut assembly



39.

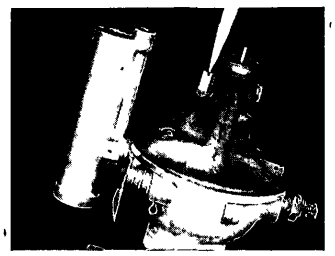
Install multipl jet n zzl .



Seat firmly in casting.

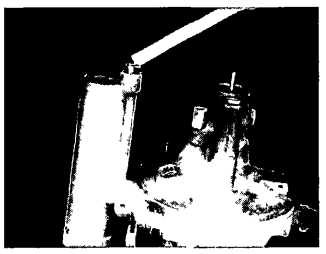
40.

Install well jet assembly.



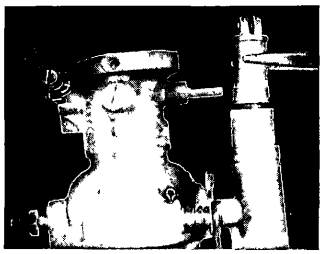
Do not install too tightly. A snug fit wil prevent distortion.

41.



Assemple parts for pump circuit.

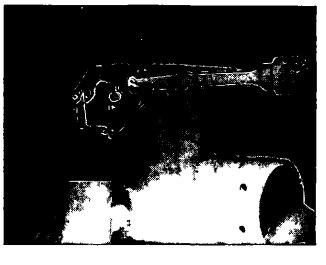
Replace both spring and leather if leather shows wear or mutilation. Test checks by blowing for free operation.



42.

Install ball check housing assembly.

43.

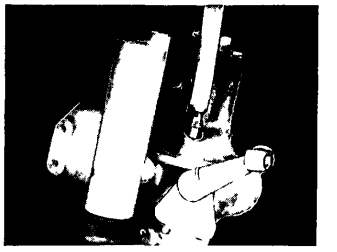


Install pump cylinder plug.

44.

Install pump plunger assembly.

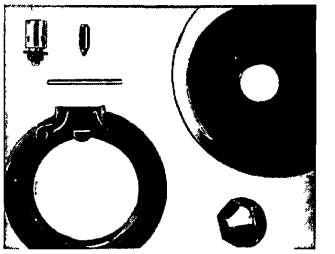
Use loading cylinder to avoid damage to leather.



45.

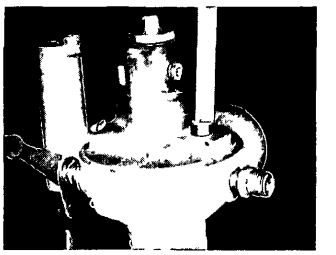
Install pump boot assembly and pump arm assembly.

Loose lever should be installed on shaft before pump arm assembly.



46.

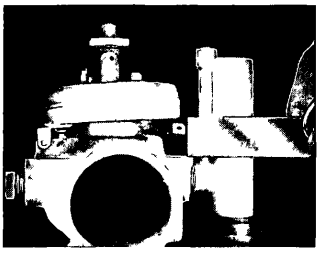
Install pump j t assembly.



47.

Assemble parts controlling gasoline level.

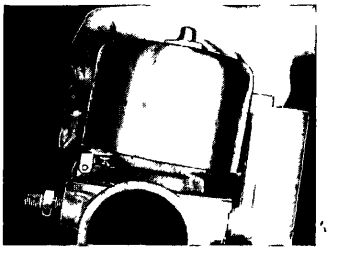
48.



Install needle seat and gasket assembly.

49.

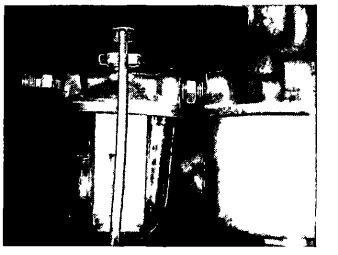
Install needle, float assembly and float pin. Set float level to specifications.



When setting float, be sure to bend lip, not float. This setting is made before bowl gasket is installed.

50.

Install bowl, and body and bowl nut.



Use new gasket. Gasket should seal entirely around bowl.

51.

Protect your work with a Carter Airdome Fuel Filter.

NOTE: On carbureters having two-piece body castings, eliminate operations 15, 16 and 31.

Always use complete new gasket assortment when servicing a Carter Carbureter.

NO CARBURETER CAN DELIVER GOOD MILEAGE OR PERFORMANCE UNLESS COMPRESSION IS NORMAL AND THE MOTOR IS PROPERLY TUNED.

CARBURETER

TRADE MARK REG. U. S PAT. OFF.
MARCA REGISTRADA

SERVICE PROCEDURE

CARTER ELECTRIC PUSHER PUMP—MODELS P600S-P602S-P603S-P604S-P804S

INSTRUCTIONS FOR TESTING, REMOVING AND OVERHAULING

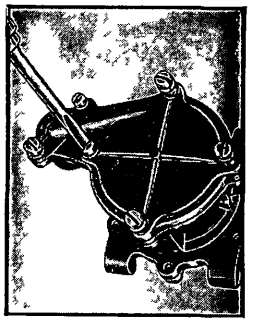
The following test should be made in vehicle before removing pump·

(1) Turn off ignition switch Disconnect fuel line at carbureter Connect fuel pressure gauge to fuel line When servicing P604S and P804S pumps disconnect fuel line at fuel tank and connect fuel pressure gauge to outlet in cover plate

(2) Turn on ignition switch (If equipped with oil switch, shunt across terminals so that pump will operate with engine stopped) If the fuel pressure on the gauge is not less than 3 pounds for a 24 volt pump, 2½ pounds for 12 volt pumps and 1¾ pounds for a 6 volt pump, with battery fully charged, the pump is satisfactory.

If the above requirements are not met, the fuel pump must be overhauled This test assumes the vehicle battery is fully charged, the wiring and fuse are in good condition and sufficient fuel is in the tank During the test it is very important that any fuel line valves connecting the pump under test to other tanks remain closed Otherwise, fuel may circulate from one tank to another and a true reading would not be obtained

If pump requires overhauling



Disconnect battery and electrical connections and tape terminal of feed wire, as a precautionary measure, so that no spark can ignite fumes in the tank. Remove complete pump (New cover plate gasket should be used when reinstalling pumps in tanks)

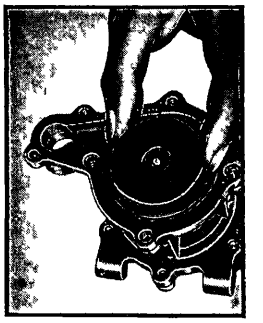
It is not necessary to remove cable from pump unless it has been damaged Proceed as follows

1.

Remove attaching screws and wire strainer from lower section of pump.

2.

With pump inverted, remove volute plate attaching screws.

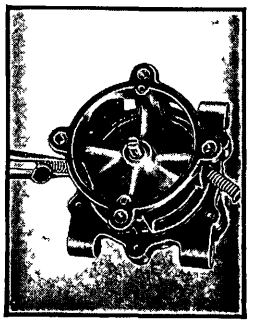


3.

Remove lower volute plate.

4

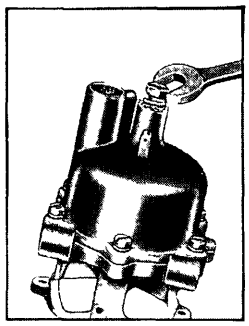
Lift out impeller and ball assembly.



5.

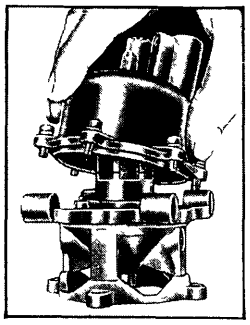
Remove upper volute casting.

6.



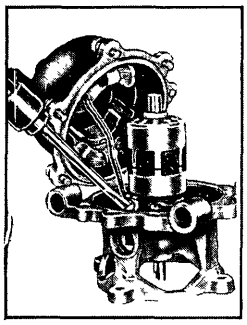
Remove both retaining screw plugs and brush assemblies.

Copyright 1946
Copyright 1951
by Carter Carburetor Corporation
All Rights Reserved



CARBURETER
TRADE MARK REG U S PAT OFF
MARCA REGISTRADA

PRINTED IN U S A

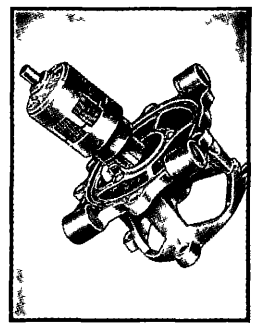


7.

Then remove hex lock nut, lock washer, keeper, and thrust bearing stud from upper body of pump.

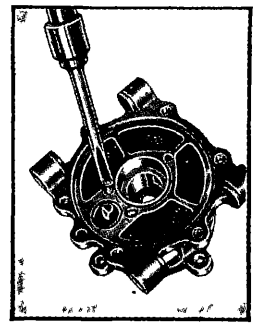
8.

With pump top side up, remove the six attaching screws and lock washers and lift off upper body of pump.



9.

Disconnect field pig tail.



10.

Remove armature.

11.

Remove the three attaching screws from inside strainer—and then remove strainer plate and strainer.

NOTE: Carefully clean all parts in clean gasoline. DO NOT USE LACQUER THINNER OR OTHER SOLVENTS Carefully blow out each part with compressed air. Be sure that all passages are clear Extreme caution must be exercised to prevent damage to field coils. Clean commutator slots of armature with cardboard. Do not use metal tool

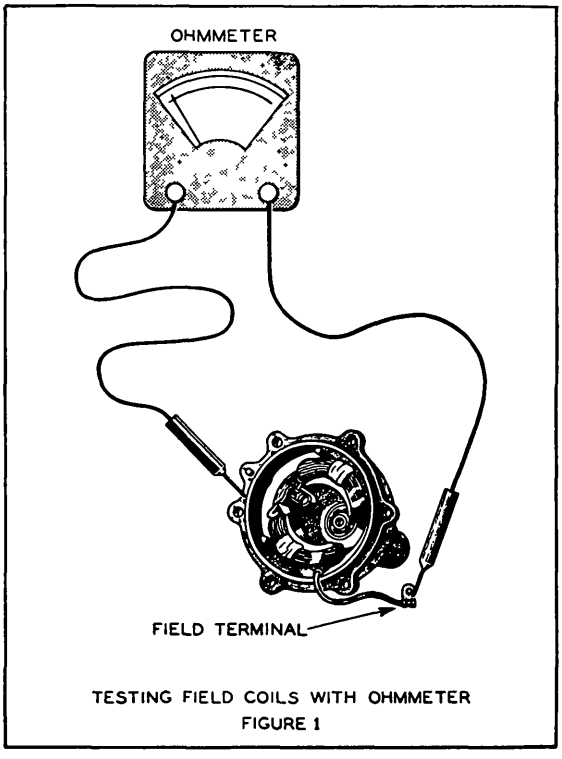
INSPECTION AND TESTING

Armature—If armature shaft bearing journals and commutator are in good condition, test as follows (this commutator operates in gasoline, therefore usual polished surface is not to be expected and noticeable threading does not indicate unsatisfactory operation)

(a) Test for ground with a test lamp **Do not attempt to repair a grounded or shorted armature since the armature is in dynamic balance and cannot be disassembled for repairs.**

(b) Check for shorts and open circuits in armature windings using meter and growler

Field Housing Assembly—If field housing, coils, and threads in tapped holes appear to be in good condition, test coils for continuity with test lamp, and if ohmeter is available check resistance of coils (Figure 1)



Resistance of field coils must be within following limits 6 volt pump—10 to 14 ohms 12 volt pump 25 to 32 ohms, and 24 volt pump—113 to 125 ohms. If these specifications are not met, use new field housing assembly.

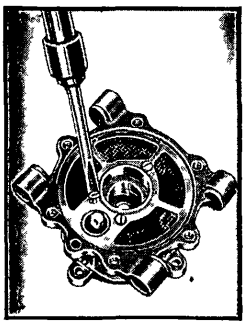
Pump Body Assembly—Inspect insulated staked-in block to which the field pigtail is attached. If it is not tight and in good condition, if brush insulator is not in good condition, or if pump body assembly is damaged warped or otherwise unserviceable, replace with new assembly

Impeller—Inspect drive pin and ball in impeller If not in good condition, replace with new assembly

Cable Assembly—Inspect attachment of cable to field housing and make sure the collar screw plug is screwed down tight and locked with set screw. If cable assembly appears to be damaged and has been removed from pump, test as follows

Use a 6 volt test lamp and check cable assembly wire for continuity of circuit and for ground. If grounded or not continuous use a new cable assembly

TESTING FIELD COILS WITH OHMMETER
FIGURE 1

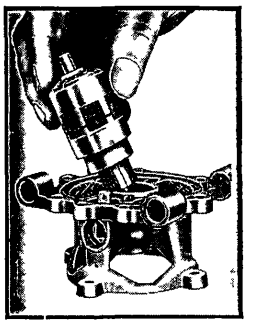


Miscellaneous Parts

Brush Assemblies—The minimum permissible brush length is 3/16 inch New brushes are 3/8 inch in length. If any doubt exists as to whether the brush lengths at the next overhaul will be less than 3/16 inch, replace both brush assemblies

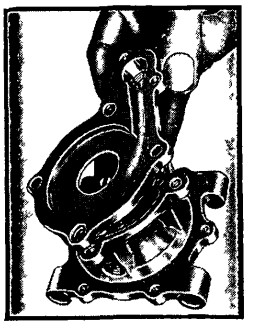
Screws, Lock Washers, Strainers and Strainer Frame—Use new parts as required

Thrust Bearing Adjusting Screw and Ball Assembly—If threads are damaged or contact surface of ball is flat, use a new assembly



TO REASSEMBLE

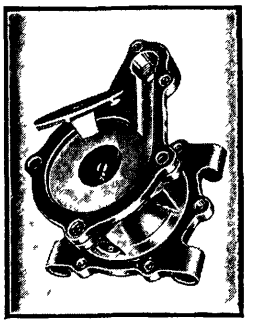
1.



Install inside strainer and strainer plate in pump housing, and the three attaching screws.

(Strainer must be below strain er plate)

2.



Install armature in pump housing.

3.

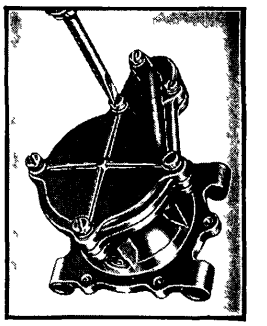
Hold armature in position and invert pump housing. Then install upper volute plate.

Be sure plate fits snugly against pump housing as one semi circular boss is larger than the other, thus allowing a tight fit in only one position (It should slide freely into place)

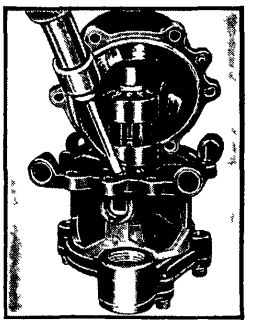
4.

Install impeller and ball assembly.

Hold armature securely and turn impeller until impeller key engages slot in armature shaft



5.

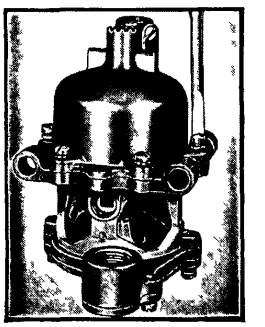


Install lower volute plate.

6.

Install attaching screws and lock washers.

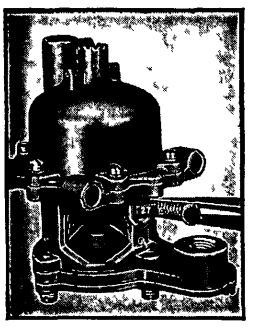
Screws must be pulled down evenly No gasket is used between upper and lower vol ute castings



7.

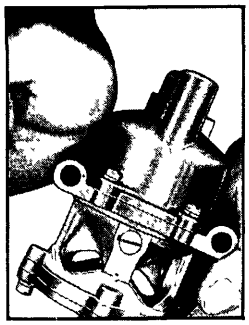
Attach field pig tail. Install upper body.

Be sure that pig tail lead wire does not rub against armature but is between field coil and housing



8.

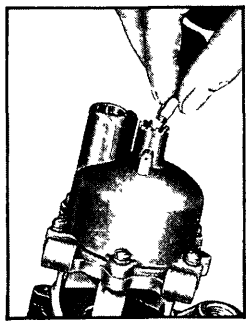
Install the attaching screws and lock washers.



NOTE:

The brushes used are made of different materials and must not be interchanged (Note that one brush housing in casting is **insulated** and one is not) The brush with the fiber insulator terminal must be installed in the **insulated** brush pocket. Turn pump on its base until you are facing brush pocket. Number stamped on face of brush must go toward left side of hole. This method of installation insures matching of contour of face of brush to commutator.

9

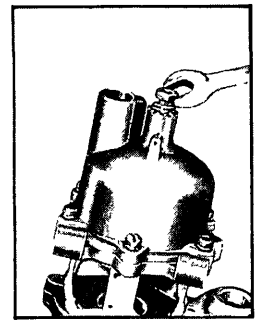


Install both brushes and screw plugs.

10.

Jar pump with h l f hand to insure bearing alignment.

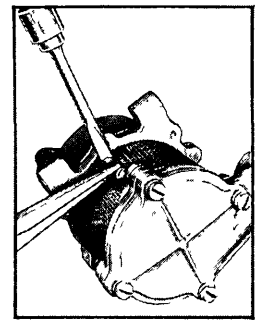
The Carter Electric Pusher Pump is equipped with self-aligning bearings.



11.

With pump top side up install thrust bearing stud. Turn down finger tight against top end of armature shaft. Then place "three pronged keeper" on thrust bearing stud. Note position of prongs in relation to the notches in casting. Loosen screw until prongs fall into the nearest slots, THEN LOOSEN ONE MORE NOTCH.

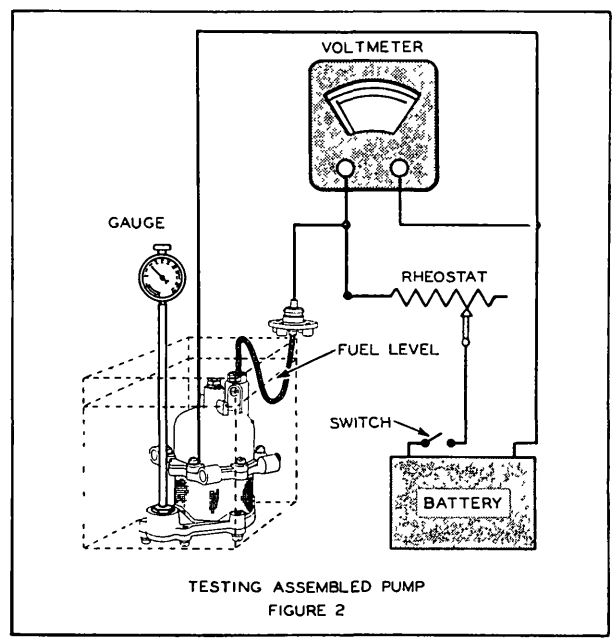
12.



Install l ck washer and hex l ck nut.

13.

Install outer strainer. Start by placing end with screw holes closest to edge into offset in casting.

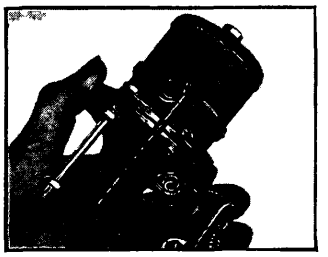


Be sure to take up all slack in screen. Tighten attaching screws securely.

TEST AFTER REASSEMBLY

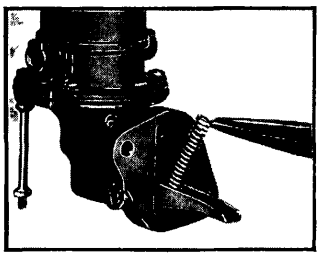
Attach fuel pressure gauge to discharge port of pump (Figure 2). Use shortest convenient length of tube between pump and gauge avoiding dips and traps. Submerge entire pump in container of dry-cleaning fluid **(never run pump dry)** after connecting it as shown in figure 2 with switch open. Operate pump.

Minimum dead end pressure on gauge should be as follows:
P600S 6 volt pump operating at 6 volts—2 pounds
P602S-P603S 12 volt pumps operating at 12 volts—3¾ pounds
P804S 12 volt pump operating at 12 volts—3¼ pounds.
P604S 24 volt pump operating at 24 volts—3¾ pounds



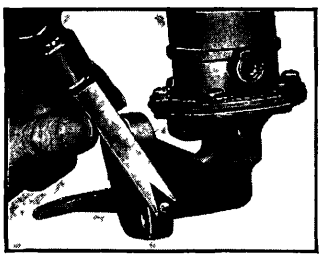
TESTING ASSEMBLED PUMP
FIGURE 2

CARTER CARBURETOR
DIVISION OF acf INDUSTRIES INCORPORATED
ST LOUIS, MO, U. S A



SERVICE PROCEDURE

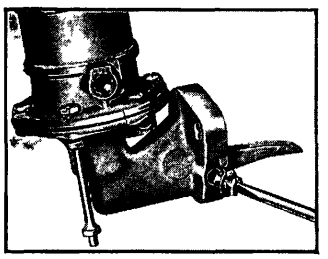
CARTER MECHANICAL FUEL PUMP



1.

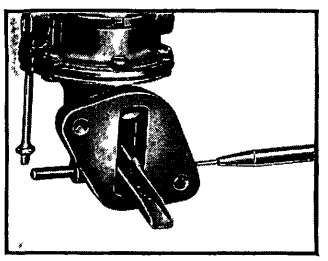
Mark pump body and valve housing to facilitate correct reassembly.

2.



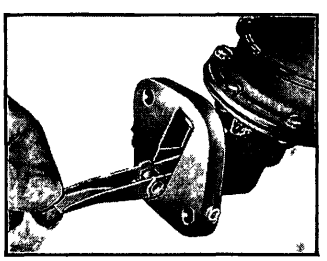
Remove cam lever return spring.

3.



Remove rivet plug.

(Use tool T109-43.)

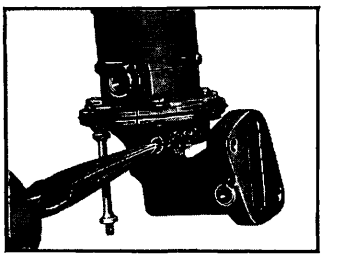


4.

Remove cam lever pin plug and washer.

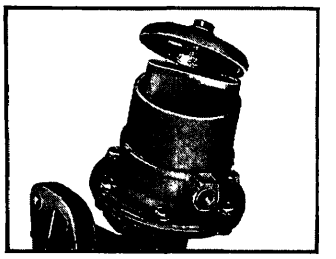
5.

Remove cam lever pin.



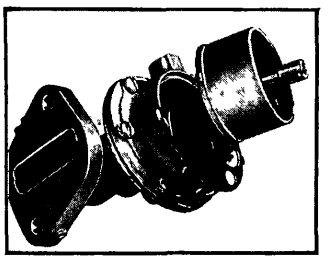
6.

Remove cam lever and spring retainer.



7.

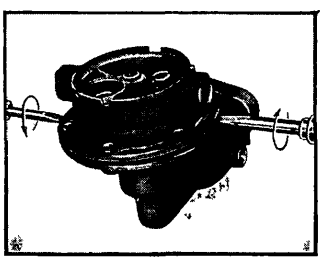
Remove vent retainer ring and packing.



8.

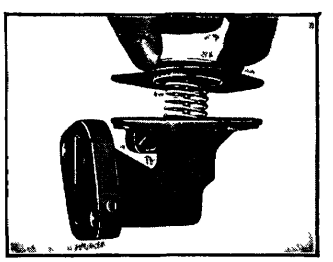
Remove bowl cover, gasket and strainer.

9.



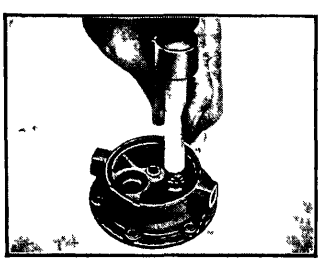
Remove bowl retaining screw, bowl and outlet airdome diaphragm.

10.



Remove pump valve housing.

Insert screw drivers between pump valve housing and body at flats of diaphragm Twist screw drivers as shown



11.

Remove diaphragm assembly.

12.

Remove both valve cage assemblies.

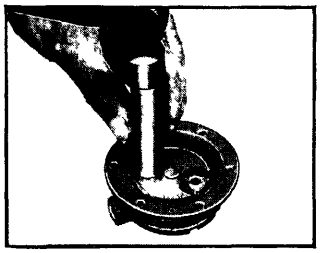
MARCA REGISTRADA

PRINTED IN U.S.A.

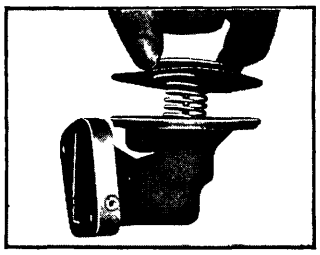
13.

Clean all parts in gasoline or solvent and dry with compressed air. Replace all worn or damaged parts.



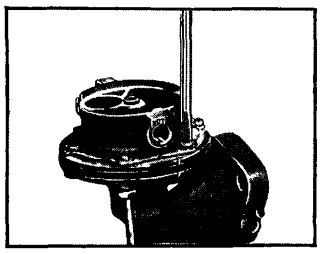
To Reassemble.

14.



Install new intake valve cage assembly.

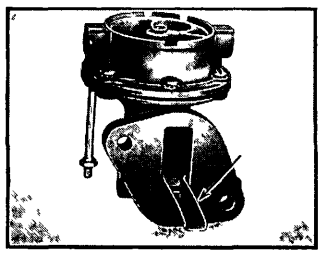
(Use tool T109-191.)



15.

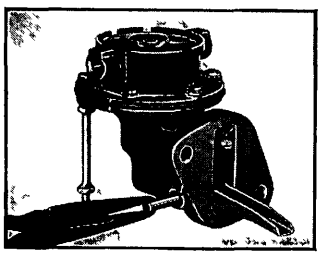
Install new discharge valve cage assembly.

16.



Install diaphragm assembly with flats toward ports.

17.

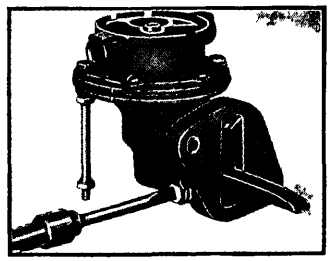


Install pump valve housing.

Align marks, then start all screws but **do not tighten.**

18.

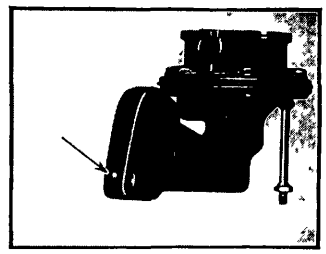
Install cam lever and spring retainer.



19.

Install cam lever pin.

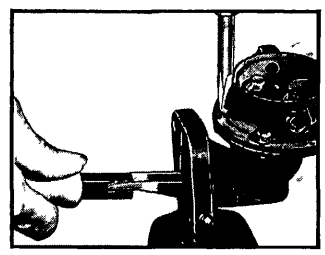
20.



Install cam lever pin plug and washer.

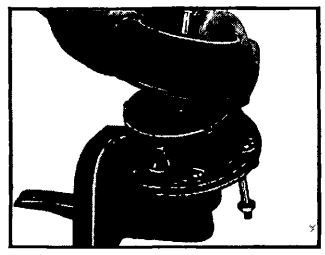
21.

Install new rivet plug.



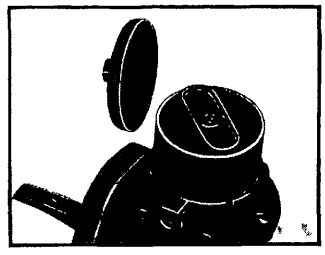
(Use tool T109 43)

22.



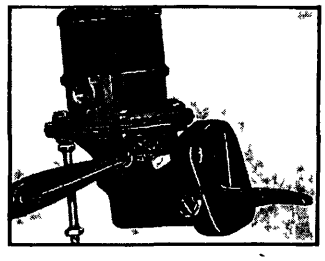
Flex diaphragm assembly to full downward position and hold in place while tightening valve housing attaching screws.

(Use tool T109 192)



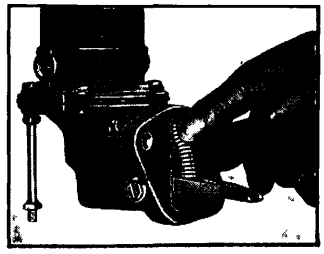
23.

Install outlet airdome diaphragm, bowl and bowl retaining screw and washer.



24.

Insert cap screw through gasket and bowl cover and install felt packing on screw. Then install strainer, bowl cover and ring gasket.



25.

Install vent packing and retainer.

26.

Install cam lever return spring.

CAUTION—When installing pump on engine be sure slot and stud holes in gasket are aligned with those in face of pump body.

1956 4 cylinder	**Fuel Pump Inlet F156-26**	**F827S, F2159S**
NOTE: Bowl upward on all 4 cylinder engines.		

Note X: Cab over engine (C.O.E.) trucks in most instances do not provide sufficient room in the engine compartment for filter installation. The following two possible installation points should be checked:

1. Outlet of fuel tank or tanks: Use F862S, F863S or F866S metal bowl filter if location is subject to flying stones from road.
2. Cut fuel line along accessible portion of truck frame and install foursome fuel filter F614S or F614SU ¼" fittings —F642S or 642SU ⅛" fittings.

Trucks or buses in fuel mileage range of 4 to 7 miles per gallon should be equipped with foursome filters F614S or F614SU —F642S or 642SU to permit longer periods between filter cleaning.

Filter installation at these points provide protection for the fuel pump as well as the carbureter.

12 Volt—Negative Ground

MODEL P603S

12 Volt—Positive Ground

MODEL P804S

12 Volt—Positive or Negative Ground
For Diesel Application

LIST PRICE (Pump Only)—$36.30

PRICES INCLUDE ALL PRICE ADJUSTMENTS TO DATE

The Carter Electric Pusher Pump is a motor driven centrifugal pump without valves. It is located inside and at the bottom of the fuel tank. Fuel flows through the pump providing cooling and lubrication. It is listed by "Underwriters' Laboratories, Inc."

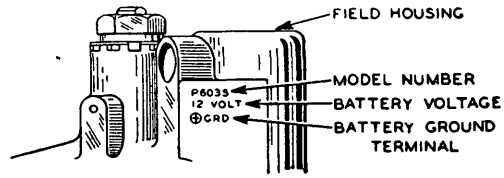
A number of its outstanding advantages are:

- **Fuel is under pressure from the tank to the carbureter, eliminating vapor lock.**
- **As there are no valves between pump and carbureter the fuel drains back into th tank wh n engine is stopped, eliminating a pressure build up and consequent hard starting on a hot engine.**
- **Fuel for starting is immediately supplied to the carbureter.**
- **Delivery of fuel is steady and non-pulsating.**
- **The armature is balanced both statically and dynamically assuring quiet operation and long life.**
- **The pump is protected from road hazards and is easily removed for fast servicing.**

FOR DIESEL (P804S)

- **Elimination of air leaks on the suction line to the injector pump insuring solid fuel flow to the pump and on some make engines full flow to the distributor.**
- **Quick refilling of filters after servicing, eliminating priming or air purging.**

UNDER NO CONDITION DOES THE CARTER PUMP REPLACE OR ELIMINATE THE REGULAR INJECTOR PUMP.

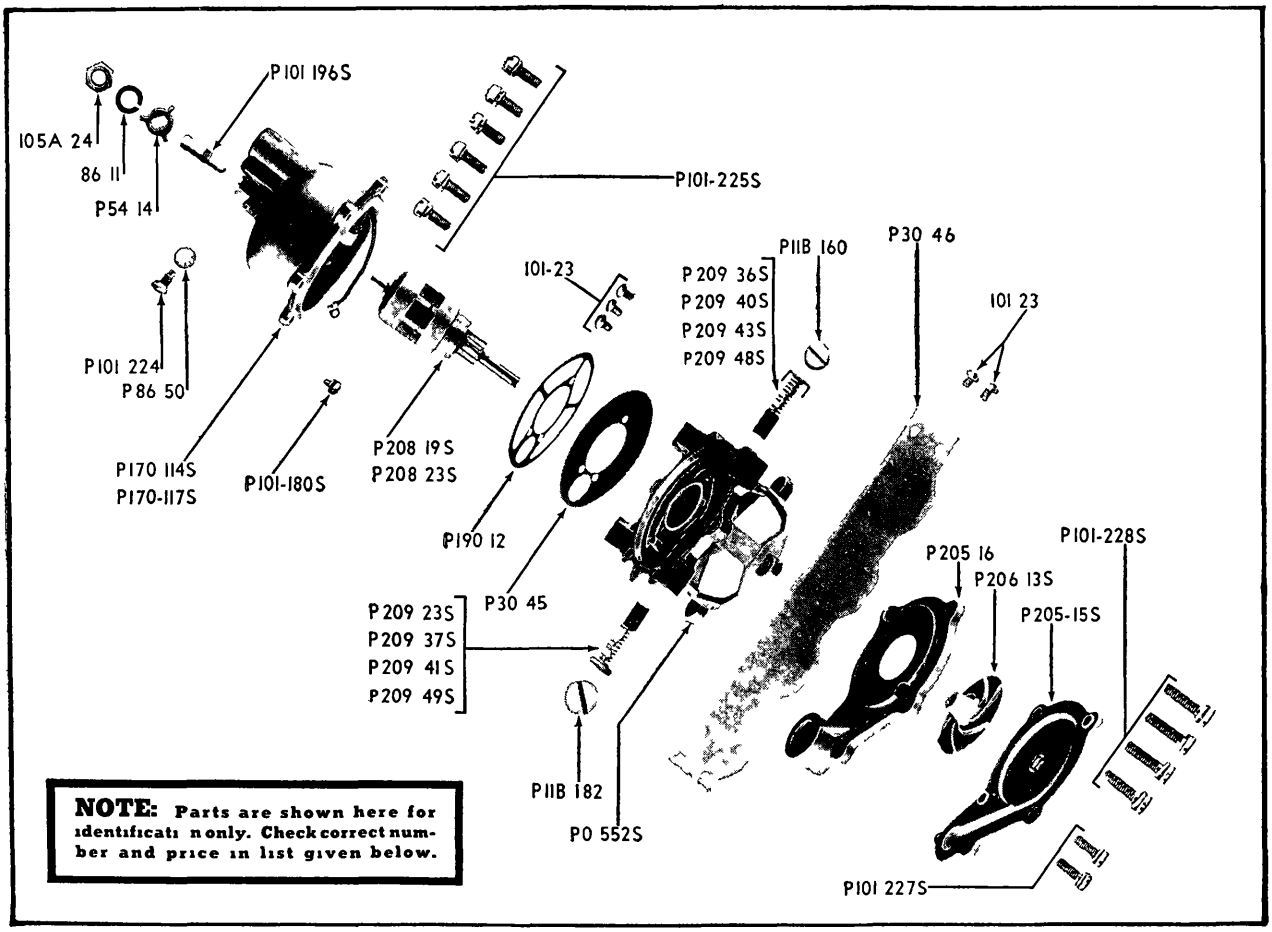


CAUTION

Always remove pump feed wire from terminal post on top of cover plate and insulate terminal on end of wire with tape as the **first** operation when removing pump from tank.

POLARITY

To insure long life, 12 volt pumps use brushes of dissimilar materials and are not interchangeable. Polarity of these pumps should not be reversed as rapid brush wear would result.



Each pump is identified as to model number, voltage and ground polarity as indicated.

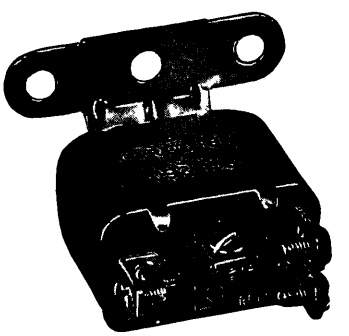
CARTER OIL PRESSURE SWITCH

For use with gasoline engines equipped with electric fuel pumps or with engine hour meters



A634S PRESSURE SWITCH

An electrical switch actuated by oil pressure—equipped with silver contact points to insure long life — protected against moisture and corrosive elements.

STOPS PUMP IF ENGINE STOPS OR OIL PRESSURE FAILS

- With engine stopped and ignition on, eliminates flooding and loading of cylinders with resulting mechanical damage and fire hazard.
- Protects engine from burn-out by stopping fuel supply if oil pressure fails.
- No fuel flow or possibility of pump drain on battery if ignition switch is left on with engine not running.

RELAY FOR USE WITH A634S OIL PRESSURE SWITCH
A192-15S, 6-12 VOLT RELAY

This four terminal relay with non-grounded coil winding is to be used in conjunction with oil pressure switch as an electrical by-pass so that electric pump may supply fuel during cranking. It is designed for this purpose in both 6 and 12 volt electrical systems.

INSTALLATION

Pressure Switch—Should be mounted in an existing tapped hole or oil line fitting at an accessible place on the engine to which point direct oil pump pressure is applied. Switch should be installed in upright position to avoid possibility of sludge accumulation eventually making unit inoperative. Do not install in a crank case return line.

Relay—May be installed on engine side of dash panel at any accessible location. **(See following pages for wiring diagrams.)**

SOME OF ITS MANY USES ARE ON AUTOMOBILES, TRUCKS, BUSES, LIGHTING PLANTS, BOATS AND INDUSTRIAL ENGINES.

C	Ignition Switch		

For Circuits with indirect foot-operated starting switch with extra terminal.

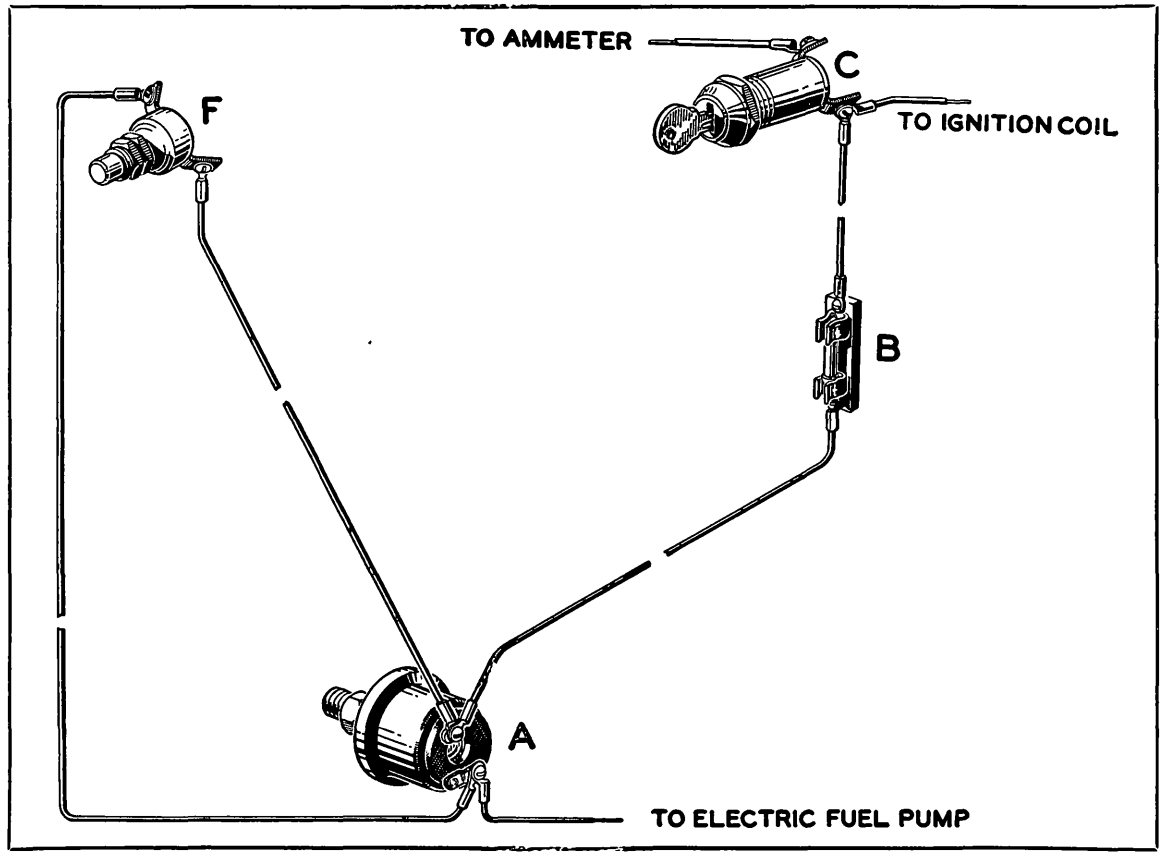

Figure 4

REF.	NAME OF PART	REF.	NAME OF PART
A	Pressure Switch (A634S)	C	Ignition Switch
B	Fuse Block	F	Starter Button (Deck Type)

For Circuits with indirect foot-operated starting switch without extra terminal.

For Circuits with indirect foot operated starting switch ("F" Fig. 3) equipped with extra terminal post for electrically operated choke. Switches with extra terminals are available and interchangeable on some makes of starting motors. Ask your dealer. When switches with extra terminals are not available a push button (F) must be used to supply current to pump when cranking as illustrated in Figure 4.
